## Taxation Trends in the European Union <br> DATA FOR THE EU MEMBER STATES, ICELAND AND NORWAY <br> 2017 edition

## Preface

Taxation is an important part of our lives. Tax policies have a major impact on businesses, the economy and ordinary citizens, and shape our public finances and public services. It is essential to have high quality data and comparable information about tax systems if we are to develop robust and effective tax policies for the future. The aim of 'Taxation Trends in the European Union' is to respond to this need by providing an overview of trends in taxation revenues, tax structures and reforms over recent years.

The 2017 edition of 'Taxation Trends' is based upon harmonized and comparable taxation data from the National Statistical Institutes, transmitted to Eurostat and validated by Eurostat, and uses the government finance statistics as well as the more detailed 'National Tax Lists' for each country. The statistics are based on the European System of National and Regional Accounts (ESA 2010), which is a major development of the previous system (ESA95). Progress has been achieved in the harmonisation of methodology and in the precision and accuracy of the concepts, definitions, classifications and accounting rules.

The report also draws upon valuable contributions from experts of the Ministries of Finance in all the countries covered by the report, including some additional data. We would like to express our special thanks for their many inputs and help without which the report would not have been possible.

In addition to the analysis of Europe-wide trends in Part 1, the report also includes a Part 2 with country chapters covering the 28 EU Member States, Iceland and Norway. For each country, key taxation indicators are provided on tax revenues as a percentage of GDP for the years 2003 to 2015. These are supplemented by factual tables presenting the latest tax reforms in each country. In Annex A, the reader can find more than 80 tables of the various taxation indicators, while Annex B contains a detailed description of the methodology used to calculate the indicators.

The data and information from this report, as well as other materials, can be found on the 'Economic Analysis' web pages of DG Taxation and Customs Union. Finally, the 'Taxes in Europe' database contains detailed and updated information on the most important taxes in force in the EU Member States.

Stephen Quest
Director-General
Directorate-General for Taxation and Customs Union

## Background information

'Taxation trends in the European Union' is produced by the Directorate-General for Taxation and Customs Union (DG TAXUD).

The Commission staff wishes to thank the Working Group on the Structures of the Taxation Systems, composed of experts from the national Finance Ministries and run by DG TAXUD, for their very helpful oral and written contributions to the report. Nevertheless, the Commission Services bear sole responsibility for this publication and its content. This report does not necessarily reflect the views of the tax departments in the Member States.

Any questions or suggestions relating to the analysis should be addressed to:
Gaëtan Nicodème, Head of the unit 'Economic analysis, evaluation \& impact assessment support'
European Commission, DG Taxation and Customs Union, B-1049 Brussels
Email: taxud-structures@ec.europa.eu

## Language and dissemination

'Taxation trends in the European Union' is available in English only. The publication can be downloaded free of charge from the website of the Directorate-General for Taxation and Customs Union (http://ec.europa.eu/taxtrends). The paper version can be purchased from any of the sales outlets listed on the website of the Publications Office of the European Union (http://publications.europa.eu).

## Additional information

The National Tax Lists for all EU countries, showing tax revenues for all major taxes, will be published online (see the sites 'Economic analysis of taxation' and 'Statistics Explained'). Continuously updated tax data are also available on the Eurostat website (online data code: gov_10a_taxag). Readers interested in taxation can find detailed information on the legal form and revenue of the taxes currently in force in the EU Member States in the 'Taxes in Europe' database (TEDB).

## Acknowledgements

This report was prepared under the direction of Stephen Quest (Director General of DG TAXUD), Valère Moutarlier (Director at DG TAXUD) and Gaëtan Nicodème (Head of Unit at DG TAXUD).

The main editor of the report was Brian Sloan (DG TAXUD), with contributions and support from Günther Ebling and Luis Peragon Lorenzo (DG TAXUD).

Support was also provided by the European Semester country desks in DG TAXUD: Maksim Baranov, Ann-Marie Bruhn, Netty Bussink, Antonella Caiumi, Niall Casey, Alain Clara, Ivana Cordasev, Eduard Folch Sogas, Roberta Grappiolo, Valeska Gronert, Morgan Guillou, Endre Gyorgy, David Howell, Malina Koleshanska-Nussbaum, Ursula Krampe, Arne Kubitza, Beatriz Laranjeira, Stephen Lawson, Juan Lopez Rodriguez, Konstantin Lozev, Milena Mathe, Pia Michelsen, Ioanna Mitroyanni, Pere Moles Palleja, Carmen Muniz Sanchez, Colin O'Driscoll, David O'Sullivan, Ela Olkuska, Martins Ozolins, Henrik Paulander, Nicolas Pavlou, Luis Peragon Lorenzo, Eleftheria Psaraki, Tanel Puetsep, Nathalie Roux, Savino Rua, Peter Schonewille, Vladimir Sika, Aga Skonieczna, Clare Southworth, Szabolcs Szilagyi, Villem Tanzer, Bogdan-Alexandru Tasnadi, Maria Teresa Sutich, Valérie Thibaudeau, Luisa Tivrisi, Tina Tukic , Ivar Tuominen, Astrid Van Mierlo, Pierre Vandenberghe, Aurimas Vasylis, Remi Verneau, Agnès Walckiers and Vassil Zhivkov.

Editorial assistance was provided by Petra Harvanova, Tatjana Lapunova and Stéphanie Veys (DG TAXUD).
The report also benefited from the contributions and suggestions of the Working Group on the Structures of the Taxation Systems, composed of experts from the national Finance Ministries, as well as comments by colleagues from other services of the European Commission.

## Introduction

The Part 1 analysis of developments in the EU outlines with graphs and tables the main trends in taxation indicators at the EU level. It summarizes the main figures presented in the report, and also provides data on top personal and corporate statutory tax rate developments, on effective average tax rates and on the so-called 'tax wedge'.

This is followed by the 'country chapters' in Part 2 which, for each of the 30 countries covered in the report, present:

- A summary table of the country's tax revenues covering revenues from direct and indirect taxes, social contributions etc., as well as revenues by economic function (consumption, capital, labour taxes). Indicators of revenues from energy, environmental and property taxes, implicit tax rates and payable tax credits are also included.
- The latest tax reforms announced or introduced in the period since the last report (for the calendar year 2016). The reforms are categorized by type of measure (VAT, CIT, PIT, etc.) and a brief description is provided along with the direction of change of the reform (base increase/decrease, rate increase/decrease).

The tables showing the 'Main features of the tax system' for each country, which appeared in previous editions, have been discontinued in this edition owing to the development of an advanced interface for the 'Taxes in Europe' database (TEDB) which now allows an easy download of the main tax system information. The detailed statistical annex (Annex A) includes datasets for the main national accounts headings (direct, indirect taxes, social contributions etc.) and by economic function (consumption, capital, labour taxes), as well as energy, environmental and property taxes and implicit tax rates. The cut-off date for most of the data in this report was 24 November 2016. This concerns the national accounts data and the more disaggregated tax data submitted to Eurostat (the National Tax Lists) which were used for calculating revenues by economic functions as well as levels of environmental and property taxes.

The methodological annex in Annex B provides detailed guidance on the methodology used for all the calculations carried out for the 'Taxation Trends' publication.

As a complement to this report, the DG TAXUD website, dedicated to the economic analysis of taxation, enables users to download the information contained in 'Taxation Trends', as well as a pdf version of the report itself. The site also provides links to numerous other sources of data, information and analytical reports in the field of taxation. More extensive information provided by national Finance Ministries on their tax systems is available on-line in the "Taxes in Europe Database" (TEDB).

As always, this report has benefited from the numerous and extremely valuable contributions received from experts of the national Finance Ministries.

## Development of the overall tax revenue in the European Union

## Level and long-term trends

## EU TAX REVENUES ARE RELATIVELY HIGH COMPARED WITH OTHER ADVANCED ECONOMIES

EU-28 taxes and compulsory actual social contributions accounted for 38.7 \% (') of GDP in 2015. In general, the EU tax level is high compared to other advanced economies: around 12 percentage points of GDP above
the level for the USA and 7 percentage points above that recorded by Japan (in 2014). It is also significantly higher than the level for New Zealand (32.8 \%), Canada (31.9 \%), Australia ( $27.8 \%$ in 2014) and South Korea (25.3 \%). Compared to its EFTA neighbours, the EU records an average tax-to-GDP ratio almost identical to that of Iceland and Norway. However, Switzerland has a lower ratio of 28.1 \%.

Graph 1: Tax revenue (including social contributions), EU and selected countries, 2015
(\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat and OECD data

## THE TAX-TO-GDP RATIO LEVELLED OFF IN 2015

Despite significant rises since 2010, EU-28 tax revenues as a percentage of GDP reach a plateau in 2015 (Graph 2), with the euro area following a broadly similar trend.

Nevertheless, 22 Member States recorded an increase in tax revenue relative to GDP in 2015 compared with 2014, most notably, Lithuania ( 1.5 percentage points of GDP), Estonia (1.3 p.p) and Slovakia (1.1 p.p.). In six Member States tax-to-GDP fell, with the largest decreases in Ireland ( -5.3 p.p.) and Denmark (- 2.7 p.p.). The fall in Ireland coincided with a very large jump in Irish GDP (see Annex A for more details).

The level of taxation in the EU differs greatly according to the Member State (Graph 3), with Denmark, France
and Belgium having the highest ratio of tax revenue to GDP ( 46.6 \%, 45.9 \% and 45.1 \% respectively), and Ireland (23.9 \%), Romania ( $28.0 \%$ ) and Bulgaria ( $29.0 \%$ of GDP) the lowest.

## REVENUE STRUCTURE BY LEVEL OF GOVERNMENT

In 2015, 53.3 \% of the aggregate tax revenue in the EU28 (including social contributions) was claimed by the central or federal government, 30.2 \% accrued to the social security funds and 10.2 \% to local government (Graph 4) ( ${ }^{2}$ ). Less than $1 \%$ of the revenue accrued to institutions of the European Union (mainly VAT own resource receipts as well as custom duties and agricultural levies). There are considerable differences in structure from one Member State to another; for instance

[^0]Graph 2: Tax revenue (including compulsory actual social contributions), EU-28 and EA-19, 2003-2015
(\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat data
Graph 3: Tax revenue (including compulsory actual social contributions), 2014-2015
(\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat data
some Member states are federal or grant regions a very high degree of fiscal autonomy (Belgium ( ${ }^{(3)}$, Germany, Austria, Spain). In the United Kingdom and Malta, the social security system is not separate from the central government level from an accounting point of view, whereas in Denmark most social security is financed through general taxation, implying large intragovernmental transfers to the social security funds.

The share of sub-central revenue (defined as municipalities plus the state level where it exists) varies from around $1 \%$
to just under one third of the total. Sweden, Germany, Belgium, Denmark and Spain in particular show high shares of total taxes received by the non-central authorities. At the other extreme, Estonia's share is $1 \%$, while in Malta local government does not levy taxes and is financed by transfers from central government. As for the share of revenue accruing to social security funds, the highest values in the EU are reported by France (52.8 \%) and Slovakia (41.9 \%). In several countries (Ireland, Malta, UK and Norway) there is no social security funds subsector in the sense of the ESA 2010 national accounts

[^1]definitions, which has an impact on the tax revenue of the other sub-sectors in these countries.

The amount of the tax revenue recorded in each of the sub-sectors of general government, however, is a very
imperfect indicator of fiscal autonomy, as the sub-sectors of general government may have (legal) rights to receive 'other current transfers' or other revenues from other subsectors. In several EU Member States decentralisation has been an important feature for several years already.

Graph 4: Revenue structure by level of government, 2015

(\% of total taxes)

Share of indirect taxes

Share of social contributions

(1) The shares can exceed $100 \%$ due to D. 995 capital transfers to the relevant sectors representing amounts assessed but unlikely to be collected.

Source: DG Taxation and Customs Union, based on Eurostat data

## Revenue structure by type of tax

Taxes are traditionally classified as direct or indirect. Direct taxes cover personal income taxes, corporate income taxes and other income and capital taxes. Indirect taxes relate to VAT, excise duties and consumption taxes, other taxes on products and production. Actual compulsory social contributions are, as a rule, directly linked to a right to benefits such as old age pensions or unemployment and health insurance.

## TAX STRUCTURES DIFFER SUBSTANTIALLY BETWEEN MEMBER STATES

The structure of taxation varies quite significantly across the Member States of the EU. When it comes to the share of direct taxes in total tax revenues, Denmark has the highest share ( $65.8 \%$ ), followed by Ireland, the United Kingdom, Sweden and Malta (as well as Norway and Iceland) with shares lying between 40 \% and $50 \%$ of revenue (see Graph 5). In general, the shares of social contributions to total tax revenues are correspondingly
low in these countries. In Denmark, there is a special reason for the extremely low share of social contributions: most welfare spending is financed out of general taxation. This requires high direct tax levels and indeed the share of direct taxation to total tax revenues in Denmark is by far the highest in the Union. However, Germany, the Netherlands and France have tax systems that are the mirror image of Denmark's, with high shares of social contributions in the total tax revenues, and relatively low shares of direct tax revenues.

A number of Member States have a much lower share of direct taxes. Many of these countries have adopted flat rate systems, which typically induce a stronger reduction in direct tax rates than indirect tax rates. These lower shares of direct taxes are counterbalanced either by relatively higher proportions of indirect taxes (for example Bulgaria (53.5 \%), Croatia (52.4 \%) and Hungary (48.4 \%)) or by relatively larger shares of social contributions (for example Slovakia (42.9 \%), Czech Republic (42.3 \%) and Lithuania (40.0 \%)).

## Distribution of the tax burden by type of tax base

## LABOUR TAXES ARE THE <br> LARGEST ELEMENT, BUT THE SHARE OF TAX BASE COMPONENTS DIFFERS GREATLY between member states

Taxes on (employed) labour income are the largest source of revenue (Graph 6), contributing nearly half of all receipts, followed by consumption taxes at roughly one third and then capital taxes at around one fifth ( ${ }^{4}$ ).

However, the structure of taxation differs markedly between Member States. Some Member States tend
to have a higher proportion of revenue raised from consumption taxes, and a somewhat lower proportion from taxes on labour. Bulgaria and Croatia stand out with around half of all revenues coming from consumption taxes. Taxes on capital range from more than a quarter of total revenue (the United Kingdom, Luxembourg, Malta, Cyprus and Italy) to less than 10 \% (Estonia). Taxes on capital and business income are generally more sizeable than those on the stock of capital, except in Greece and the United Kingdom where in 2015 they are fairly evenly matched.

[^3]Graph 6: Distribution of the total tax burden according to type of tax base 2015
(\% of total tax burden)

[^4]
## Taxation of consumption

## SHARE OF CONSUMPTION TAXES IN TOTAL REVENUE GREW SLIGHTLY IN 2015

EU-28 revenues from consumption taxes as a percentage of total taxation increased slightly: from 28.5 \% in 2014 to
28.7 \% in 2015 (see Table 40 in Annex A). The implicit tax rate on consumption ( ${ }^{5}$ ) for EU-27 has also risen steadily since 2009 (see Graph 7), reaching 20.5 \% in 2015. The figure for the euro area ( $20.4 \%$ in 2015) appears to be converging on that for the Union as a whole.

Graph 8: Decomposition of the ITR on consumption 2015
(\%)

Source: DG Taxation and Customs Union, based on Eurostat data
${ }^{(5)}$ The ITR on consumption is the ratio of the revenue from all consumption taxes to the final consumption expenditure of households.

Graph 9: Development of average standard VAT rate, EU-28, 2000-2017
(\%)

Source: DG Taxation and Customs Union

The ITR on consumption rose in 20 Member States, and fell in seven (see Table 79 in Annex A). The increases were highest in Czech Republic ( +1.6 percentage points) and Bulgaria (+1.2 percentage points). The highest movement in the other direction was in Luxembourg (-2.3 percentage points).

## SIGNIFICANT DIFFERENCES <br> IN THE COMPONENTS OF TAXATION OF CONSUMPTION

VAT typically accounts for between two-thirds and three quarters of the ITR on consumption (Graph 8). In Sweden, VAT represents just over $75 \%$ of the ITR (the highest in the EU), compared with 54 \% in Greece (the lowest EU value).

However, other non-VAT components are also significant. On average in the EU, energy taxes make up around 17 \% of the ITR on consumption. These are mostly composed
of excise duties on mineral oils. These taxes are a relatively significant component of the ITR on consumption for Italy and Greece, but contribute least to the indicator in Hungary, Malta and Belgium. The next important category is tobacco and alcohol which account for $7 \%$ of the ITR on average across the EU.

## STABILITY IN VAT RATES IN 2017

Only two Member States changed their standard VAT rates in 2017: Greece (from 23 \% to 24 \%) and Romania (from $20 \%$ to $19 \%$ ). As a result, the EU-28 average standard rate remained at $21.5 \%$ in 2017 , the same as in 2016 (Graph 9). The sharply rising trend in standard VAT rates up to 2014-15 appears to have stopped.

The highest VAT standard rate is found in Hungary (27 \%), followed by Croatia, Denmark and Sweden (all $25 \%$ ). The lowest rates are in Luxembourg (17 \%) and Malta (18 \%).

## Taxation of labour

## TAX BURDEN ON LABOUR REMAINS STABLE SINCE 2012

The implicit tax rate on labour ( ${ }^{6}$ ) for the EU-28 was 35.9 \% in 2015 (Graph 10). Although it fell in 2009, it subsequently increased once again, and since 2012 it has been at, or just under the $36 \%$ level, slightly above
its pre-crisis level. Since the economic crisis, lowering the tax burden on labour has proven difficult to achieve, as can be seen from the continuing upward trend since 2009. The trend in the euro area is broadly similar, but the implicit tax rate on labour ( $38.6 \%$ in 2015) is at a higher level than the EU-28.

Graph 10: Implicit tax rate on labour, 2003-2015
(\%, base-weighted averages)

Source: DG Taxation and Customs Union, based on Eurostat data

The level of tax burden on labour varies substantially between Member States ( ${ }^{7}$ ). The highest ITR on labour is found in Belgium ( 43.6 \% in 2015), Italy ( 43.2 \%) and Austria (43.1 \%), and the lowest in Malta (23 \%), Bulgaria (23.9 \%) and the United Kingdom (24.8 \%). It should be noted that the value of the ITR on labour would be lower for those countries with labour-related payable tax credits ${ }^{\left({ }^{8}\right)}$ if the latter were excluded: for example, for Italy, taking into account the tax expenditure component of the in-work payable tax credit (the so-called '80 euros bonus' introduced in 2014) the ITR on labour would be $42.1 \%$ in 2015, down 2 percentage points from 2013. Of the EU-28 countries, 19 registered an increase in the ITR on labour between 2014 and 2015 (see Table 80 in Annex A), the largest rise being in Poland (from 32.9 \% in 2014 to 34.1 \% in 2015), and the steepest decline in Estonia (from 35.7 \% to 34.4 \%).

## AVERAGE TOP PIT RATE STABLE IN 2017

The top personal income tax (PIT) rate was 39 \% in 2017 for the EU-28 (simple average) compared with 38.9 \% in 2016 (Graph 11). It had fallen sharply from 47.2 \% in 1995 to 38 \% in 2009. Since then the average top rate increased to around the $39 \%$ level, but has not moved substantially since 2013. Since 2009, it is also noticeable that the average rate for the euro area has increased more sharply than that for the EU-28. In 2017, rate rises occurred in two Member States - Greece and Luxembourg - and rate decreases were recorded in four - Croatia, Italy, Portugal and Finland (Table 2).

[^6]Graph 11: Development of top personal income tax rate, 1995-2017
(\%, simple averages)

Source: DG Taxation and Customs Union

The top PIT rate varies very substantially within the Union, ranging from a minimum of $10 \%$ in Bulgaria to more than 55 \% in Sweden, Portugal and Denmark (see Table 2). Of course, the picture given by the PIT rates is incomplete. It is not only the level and change of the top PIT rates that is relevant, but also the income level at which they are applied. Moreover, the progression of PIT rates applied, the structure of allowances and tax credits, and the definition of the tax base play a key role in defining the effective tax burden.

## TWO THIRDS OF LABOUR TAXES <br> ARE SOCIAL CONTRIBUTIONS AND PAYROLL TAXES

In most Member States, social contributions account for a much greater share of labour taxes than personal income tax. On average in the EU, two thirds of the overall ITR on labour consists of social contributions
and payroll taxes paid by employees and employers (see Graph 12). In Denmark, where social contributions are very low as most welfare spending is financed out of general taxation, personal income taxes account for $96 \%$ of the ITR on labour. In Ireland and the UK, PIT is also a relatively large component of the ITR ( $62 \%$ and 52 \% respectively). In Poland, on the other hand, personal income tax is $17 \%$ of the ITR on labour.

(differences in percentage points)

[^7]Graph 14: Tax wedges for a single worker with $67 \%$ of average earnings, no children
(\% of total labour costs)

Source: DG Taxation and Customs Union, based on OECD data

Between 2005 and 2015, the components of the ITR on labour changed markedly in several Member States (see Graph 13), with twenty countries increasing their ITR over the period. Overall for the EU-28 the ITR on labour rose by 0.7 percentage points, with personal income taxation of labour, employers' social contributions and payroll taxes and employees' social contributions all edging up slightly.

## TAX WEDGE FOR LOW EARNERS DOWN SLIGHTLY YEAR ON YEAR, BUT OVERALL TREND IS MIXED

The discussion in the preceding section is based on the ITR on labour, which gives a picture of the average tax burden on labour across all income classes. However, even at an unchanged overall tax level, the burden of taxation may be shifted between high and low-income taxpayers resulting not only in redistribution but notably also in a different impact on employment. In particular,
over the last decade policymakers have often resorted to cuts in labour taxes that are targeted to the bottom end of the wage scale in order to boost employability of low-skilled workers. To evaluate progress in this direction, this section looks at the tax wedge - i.e. the difference between labour costs to the employer and the corresponding net take-home pay of the employee.

Table 3 and Graph 14 focus on the 'Tax wedge on low wage workers', which is the tax wedge for a single worker without children at two thirds of average earnings $\left({ }^{( }\right)\left({ }^{(1)}\right.$. The EU-28 tax wedge was slightly lower in 2015 compared with the previous year ( $36.1 \%$ versus $36.4 \%$ in 2014). However, the picture is mixed across Member States with 13 registering a year-on-year fall, 12 an increase and three no change. Taking a longer time frame, the tax wedge has fluctuated a lot, with the EU average falling between 2005 and 2009, before rising again until 2012 and then decreasing once more. In the period since 2009, 14 Member States have seen an increase in the tax wedge while 12 posted a fall.

## Taxation of capital

## TOP CORPORATE INCOME TAX RATES CONTINUE TO EDGE DOWNWARDS

The EU average top rate of tax on corporate income fell from 22.5 \% in 2016 to 21.9 \% in 2017, continuing a gentle downwards trend since 2009 (Graph 16), but at a much slower rate than the drop observed in the decade or so up to 2009.

Although the decreasing trend has been quite general, corporate tax rates still vary substantially within the Union (see Table 4). The adjusted statutory tax rate on
corporate income varies between a minimum of $10 \%$ in Bulgaria to top statutory rates equal to or above $30 \%$ in Malta, France, Belgium and Germany, although tax provisions may limit the rate effectively applied. Six Member States have lower rates in 2017, with the largest reductions being seen in Hungary (10.8 \% in 2017 compared with 20.6 \% in 2016) and in Italy ( 27.8 \% compared with 31.3 \%). Since 2009, 15 Member States have lowered their top CIT rates, while three have raised them.

## Graph 15: Corporate income tax revenues, 2003-2015 <br> (\% of GDP, GDP-weighted average) <br> 

Source: DG Taxation and Customs Union, based on Eurostat data

## CAPITAL TAXATION: REVENUES EDGE UPWARDS

EU-28 revenues from taxes on capital increased to $8.4 \%$ of GDP in 2015, up from $8.2 \%$ the previous year continuing their upward trend since 2010 (Table 53 in Annex A).

Corporate income tax revenues rose to 2.6 \% of GDP in 2015 compared with 2.5 \% in 2014. While corporate tax rates have fallen steadily in recent years (Graph 16), revenues from corporate income tax dropped sharply after the economic and financial crisis (Graph 15), and despite some growth they have not yet recovered their pre-crisis levels.

Source：DG Taxation and Customs Union

 the macro-financial adjustment programme and prior to the first disbursement of assistance, the corporate income tax rate was increased to $12.5 \%$ (with effect on 1.1.2013).
France: $33.33 \% ; 34.43 \%$ including $3.3 \%$ additional social surcharge for large companies; $36.1 \%$ (2011-12) and $38.0 \%$ (2013-15) including the temporary surcharge (contribution exceptionnelle) for very large companies (turnover above EUR 250 million). Companies can benefit from a tax credit equal to $6 \%$ (since 2014) of the payroll for (most) employees. The local business tax (contribution économique territoriale) is not included (capped to 3 \% of value added). Germany: The rate includes the solidarity surcharge of $5.5 \%$ and the Berlin rate for the trade tax ('Gewerbesteuer': $14.35 \%$; in 2012 average trade tax rate for former federal territory was $13.825 \%$ and $12.985 \%$ for new Lander). From 1995
to 2000 the rates for Germany refer only to retained profits. For distributed profits lower rates applied. Until 2007 the trade tax was an allowable expense for the purpose of calculating the income on which corporation tax is payable. As from 2008 enterprises are subject to an overall tax burden of around $30 \%$.
Estonia: Corporate income tax is applied only on distributed profits, not earned profits. Greece: The rate includes a spies with net income above EUR 5 million. The contribution is levied at progressive rates, with the marginal rate reaching $10 \%$. In 2010 (2009 income) the contribution applies to income above EUR 100000 , top rate being $10 \%$ (income above EUR 5 million). Croatia: From 1st January 2017 the basic tax rate was reduced from $20 \%$ to $18 \%$ and to $12 \%$ for taxpayers whose annual revenues are below HRK 3 million.
Spain: During the whole period of the table, the exploration, research and exploitation of deposits and underground storage hydrocarbons entities have been applying an increased tax rate, which is 5 percentage points higher than Hungary: Including the local business tax of maximum $2 \%$ that applies on the gross operating profit (turnover minus costs) and which is deductible from the CIT. In the typical case of a local tax of $2 \%$, the total tax paid is $2+(9 \times 0.98)=$ 10.82. For energy providers and other utilities, a cca. $50 \%$ CIT rate applies. An 'Innovation tax' of $0.3 \%$ is also due on the same base as the local business tax while micro and small enterprises are exempted from paying (not included in the calculation).
Ireland: $25 \%$ for non-trading income, gains and profits from mining petroleum and land dealing activities. Until 2003, Ireland applied a $10 \%$ CIT rate to qualifying manufacturing and services companies.
Italy: As from 1998 the rates for Italy include IRAP (rate $3.90 \%$ ), local tax levied on a tax base broader than corporate income. As of $201210 \%$ of IRAP is deductible from CIT tax base (the figure in the table takes this deduction into Lithuania: A 'social tax' (applied as a surcharge) has been introduced in 2006 and 2007 (at $4 \%$ and $3 \%$ respectively). As from 2010, companies with up to ten employees and taxable income not exceeding LTL 500000 (approx. EUR 144 810), benefit from a reduced tax rate of $5 \%$. As from 2012, the threshold has been increased to LTL 1000000 (about EUR 289603 ) and from 2015 to EUR 300000 .
Luxembourg: Basic local tax (municipal business tax) is $3 \%$ to be multiplied by a municipal factor ranging from 2 to 3.5 . The rate in the table is for Luxembourg City,
Malta: The rate shown does not take into account the corporate tax refund system
35 million and $7 \%$ on profits exceeding EUR 35 million. 35 million and $7 \%$ on profits exceeding EUR 35 million.
Slovakia: The standard CIT rate was reduced to $22 \%$ on the
registered companies and EUR 2880 if annual turnover above EUR 500 000).
United Kingdom: Rates given are rates for the tax year starting in April.

## STABILISATION IN EFFECTIVE AVERAGE TAX RATES

Another indicator of the tax burden on corporations is the effective average tax rate (EATR). This is a forward-looking micro based indicator computed by applying some of the basic tax rules to a hypothetical investment, as opposed to the ITRs which are based on real aggregated revenues and tax bases derived from national accounts data (backward-looking). The methodology used for the calculation of EATRs is explained in the ZEW report by Devereux et al. (2008)
and follows the methodology set out by Devereux and Griffith $(1999,2003)$.

EATRs have decreased over the last decade largely in line with the fall in the CIT rate, but the latest data show a stabilisation around the 21 \% level for the EU-28 since 2010 (see Graph 16). The EU-28 average EATR in 2016 was 20.9 \%. However, EATR levels vary considerably between Member States (see Table 85 in Annex A). The EATR is the lowest in Bulgaria (9 \%), Cyprus (13.1 \%), Lithuania (13.6 \%), and Ireland (14.1\%) and the highest in France (38.4 \%), Malta (32.2\%) and Spain (30.3 \%) ( ${ }^{11}$ ).

Graph 17: Environmental tax revenues, 2003-2015
(\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat data

## Environmental taxation

## EU REVENUES RELATIVE TO GDP REMAIN STABLE SINCE 2012

Since the economic crisis, environmental taxation has once again taken on a key role in policy debates as an instrument for raising revenue in a beneficial way through improving the quality of the environment while creating room to deliver labour tax cuts and thus help to boost employment.

The overall trend at EU level can be seen in Graph 17. After falling between 2002 and 2008, environmental tax revenues as a percentage of GDP started to rise in 2009. However, they would appear to have slowed down since 2012, and are now positioned at 2.4 \% of GDP (in 2015).

The ratio of environmental tax revenues to GDP differs between Member States, with Croatia (4.1 \%), Denmark (4 \%), Slovenia (3.9 \%) and Greece (3.7 \%) having the highest ratios, and Slovakia and Lithuania (both $1.8 \%$ ) registering the lowest.

These tax revenue trends shed light on the importance of environmental taxes as a revenue source, but need to be interpreted with caution. They are the result of changes in environmental tax rates and tax bases. A zero increase in tax revenue may arise when the underlying tax base (e.g. fossil fuel consumption) has decreased, but the corresponding tax rates have increased. Such "green" dynamics may not be captured fully in the tax revenue data.
${ }^{(11)}$ It should be noted that the ZEW calculation of the corporate statutory effective tax rate for Spain includes the IAE (Impuesto sobre Actividades Economicas) which is a local tax levied on the operation of a business activity. It can be characterized as a non-income tax on business capital. It is only loosely linked to corporate turnover and does not relate to corporate profit.

## LARGE DIFFERENCES IN COMPOSITION AND DYNAMICS BETWEEN MEMBER STATES

Graph 18 shows the composition of environmental tax revenues in 2015. The preponderant role of energy tax revenues in environmental tax receipts is clear for almost all countries, (accounting for some 77 \% of EU-28 environmental tax revenues) - of which transport fuel taxes represent around $70 \%$ of receipts - followed by non-fuel transport taxes ( $20 \%$ ) and pollution / resources taxes (4 \%).

Changes in the structure of environmental tax revenues between 2005 and 2015 can be seen in Graph 19, with Greece, Slovenia, Italy and Estonia displaying the largest

## Property Taxes

## TWO-THIRDS OF PROPERTY <br> TAXES IN THE EU ARE RECURRENT TAXES

Property taxes cover recurrent taxes on immovable property, which typically are paid annually and are linked to some measure of the value of the property, and
increases in both environmental tax revenues overall and in energy tax receipts.

## AROUND THREE QUARTERS OF energy tax revenues come FROM TRANSPORT FUEL

Around $70 \%$ of energy tax revenues in the EU are raised on transport fuel. In 6 Member States transport fuel represents over $90 \%$ of energy tax revenues (Graph 20). Denmark, Sweden, Italy, the Netherlands, Finland and Greece have the lowest share of transport fuel tax revenues (between $40 \%$ and 62 \%). Overall energy tax revenue is highest in Slovenia, Greece and Italy (3 \%, 3 \% and $2.8 \%$ of GDP respectively).
other property taxes, which include taxes on property transfers and transactions. In the EU generally, it is recurrent property taxes that dominate, accounting for 1.6 \% of GDP and 62.8 \% of all property taxes in 2015 (Graph 21 shows the composition of property taxes for the Member States ordered by the amount of recurrent property taxes as a percentage of GDP).

Graph 18: Structure of environmental taxes, 2015
(\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat data

Recurrent taxes on real estate property have attracted increasing attention from policy makers because in many countries where they are low they offer a potential source for increasing revenue, while at the same time they are considered to be the least detrimental to economic growth given the immobility of the tax base.

Nevertheless, there are significant differences between Member States. The highest recurrent property taxes can be found in the France ( 3.2 \% of GDP), the United Kingdom (3.1 \%) and Greece (2.7 \%). The lowest rates are
found in Croatia ( ${ }^{(2)}$ ), Luxembourg and Malta (which does not levy this type of tax at all). Other forms of property taxes are relatively high in Belgium, Spain, France, Luxembourg and Malta.

The trend since 2009 has been different for the two types of property taxes. Revenues from recurrent taxes have risen from 1.3 \% of GDP in 2009 to 1.6 \% in 2015, while revenues from other property taxes fell sharply in 2009 to 0.8 \% of GDP (from 1.1 \% the year before), but have gradually increased again reaching 1 \% of GDP in 2015.

## Payable tax credits

## WHAT ARE PAYABLE TAX CREDITS?

In this section we look at some figures for so-called 'payable' tax credits because the way they are treated in the calculation of tax revenues can have some impact on taxation indicators.

Tax credits reduce tax liabilities. If the amount to be credited to the taxpayer is higher than the tax liability, the exceeding amount is either 'wasted' or actually transferred by the government to the taxpayer. The former category of tax credits is called non-payable (or 'wastable') tax credits, while the latter category is called payable (or 'non-wastable') tax credits.
'Payable tax credits' are credited against a tax liability, and only need to be paid out to beneficiaries if they exceed the tax liability. Conceptually, a payable tax credit can be split into two components: one component (the 'tax expenditure component') is used to decrease the tax liability, and the other (the 'transfer component') is the remainder left over if the total tax credit amount exceeds the tax liability, and is paid directly to a recipient as a benefit payment.

## THE TREATMENT OF PAYABLE TAX CREDITS IN THE RECORDING OF TAX REVENUES

There are two main methods for recording payable tax credits in tax revenue statistics.

- the 'gross method' which treats payable tax credits as expenditure provisions, and consequently deducts neither the tax expenditure component nor the transfer component from recorded tax revenues - this is used in most international national accounts manuals (ESA 2010, the SNA 2008, and the IMF GSM 2014);
- the 'split method' which deducts only the part of payable tax credits used to reduce the tax payer's tax liability (the 'tax expenditure component' of the credit) - this method was used by most countries in the past and is currently favoured by the OECD.

For those countries where tax credits are widely used, this difference in treatment is important because it can have a significant effect on the reported tax revenues.

The European System of National Accounts (ESA) recently underwent a major revision, and this included a harmonisation in the way payable tax credits are recorded. The new system, ESA 2010, adopts the 'gross method' of reporting - following on from the harmonisation on the recording of tax credits introduced in the SNA 08 and in line with the IMF's Government Finance Statistics Manual 2014 - with the whole amount of payable tax credits recorded as government expenditure (under the appropriate expenditure transaction). To keep the accounting of government budget balance right, this means that the full amount of the payable tax credits is also recorded on the other side of the government budget, as tax revenues. This recording method has important implications for tax indicators since it might increase the recorded tax revenues of those Member States that use payable tax credits.

Another recording method (the 'split method') is favoured by the OECD. This involves deducting from tax revenues that part of the payable tax credits that is actually used to reduce the tax liability but including the part of the payable tax credits that is actually transferred to the tax payer as a component of government expenditure.

Both methods have their own methodological rationale. The gross approach adopted under ESA 2010 clarifies an issue that was previously neither explicit nor harmonized. Under ESA95, this left some scope for the different ways of recording of the total tax revenue and total expenditure of general government. The rationale for recording nonpayable tax credits and tax reliefs/ reductions acting on the tax base as reducing government revenue (and the tax burden) is that these affect only tax payers. On the other hand, payable tax credits, by their very nature, can affect tax payers and households and corporations not paying taxes alike. A decision to introduce a tax credit
or not have a tax credit but budget an equal amount of expenditure (e.g. subsidies, social benefits, other current transfers or capital transfers in particular investment grants) thus has the same effect on government net lending / net borrowing. There is thus a case for such a decision to be neutral on national accounts aggregates such as GDP, GNI and key government aggregates.

On the other hand, the split approach aims to avoid an increase in tax revenues due to the inclusion of amounts that are not collected. It also eliminates the distinction between payable and non-payable tax credits which are always recorded on a 'net' basis, that is, only the net amount is recorded on the revenue side of the government budget and nothing is recorded as a subsidy on the expenditure side.

## COUNTRIES REPORTING PAYABLE TAX CREDITS

It should be noted that not all countries use tax credits and/or payable tax credits as a means of providing tax incentives to their taxpayers. Payable tax credits exist in ten EU Member States (Belgium, Czech Republic, Denmark, Ireland, Spain, France, Italy, Austria, Slovakia and the United Kingdom) as well as Iceland and Norway. Luxembourg and Iceland do not yet report the relevant items. The remaining countries report this item as "not applicable".

In those countries covered by this report with payable tax credits, the relative amount of such credits varies considerably (Graph 22). France (1.2 \%) and Italy ( 0.9 \%) have the highest percentage of payable tax credits in relation to GDP. At the other extreme, Spain, Iceland and Norway record payable tax credits of less than 0.1 \% of GDP.

Graph 22: Size of payable tax credits, 2015

Source: Eurostat, except for Czech Republic and Iceland (source OECD).

The breakdown of payable tax credits between the tax expenditure component and the transfer component can be seen in Table 5. This decomposition is not available for all countries.

While the main data sources (Eurostat and OECD) ( ${ }^{(3)}$ are generally comparable in their recording of payable tax credits, there are a limited number of significant divergences. For Germany, the data reported to Eurostat under the ESA 2010 national accounts system indicate no payable tax credits for Germany, whereas the OECD data show tax credits worth EUR 42 billion, of which EUR 26 billion for the tax expenditure component. For the UK, the only payable tax credits reported to Eurostat are for corporate taxes, and there are no reported payable tax credits related to individual income/profit. However,
the OECD data contain amounts for both, with individual tax credits accounting for a total of $£ 29$ billion, of which $£ 2.4$ billion is the tax expenditure component.

## THE EFFECTS OF THE DIFFERENT METHODS ON TAX REVENUE INDICATORS

The impact of the two different ways of recording payable tax credits can be seen in Table 6. Using the 'gross method' leads to recorded tax revenues that are between 0.01 and 0.7 percentage points of GDP higher than they would be under the 'split method'. The countries where this divergence is the greatest are the Czech Republic, Italy and Denmark.

| Norway | 185 | 42 | 142 |

(') Other data for the year 2015 submitted by the German Federal Ministry of Finance to the OECD show significant tax credits: Total tax credits EUR 42151 million; Tax expenditure component EUR 26442 million; Transfer component EUR 15708 million. However, these amounts are not considered as tax credits under ESA 2010 definitions followed by Eurostat.
(2) Data submitted by the Luxembourg to the OECD give a total tax credit of EUR 198 million. However, these amounts are not recorded in the ESA 2010 data of Eurostat.
${ }^{(3)}$ ) Data (for 2015) submitted by the UK to the OECD show significantly higher levels of tax credits: Total tax credits EUR 42986 million; Tax expenditure component EUR 4589 million; Transfer component EUR 38397 million. However, only the amounts relating to corporate taxes are considered as tax credits under ESA 2010 definitions followed by Eurostat.

In addition to the impact on the overall tax revenue to GDP ratio, the treatment of payable tax credits can have an effect on the figures reported under labour tax revenues (and the associated ITR on labour) for countries with payable working tax credits, and capital tax revenues for countries with payable credits for corporations.

In the main graphs and tables of this report this ESA 2010 approach has been employed (gross method), but the effects of adjusting the tax to GDP indicator for payable tax credits are shown in section G of the country tables in Part 2.

## Implicit tax rate on capital

## INTRODUCTION

The implicit tax rate (ITR) on capital attempts to measure what percentage of the potential capital tax base is actually collected in revenue. It is defined as the ratio between taxes on capital and the aggregate of capital and savings income. The numerator includes taxes levied on the income earned from savings and investments by households and corporations, taxes related to stocks of capital stemming from savings and investment in previous periods, as well as taxes on transactions of assets. A full definition and description of the methodology for the ITR on capital (based on ESA2010) can be found in Annex B.

The ITR on capital and its sub-divisions have not been published in Taxation Trends since the 2014 edition. This is because these indicators are currently under review and will be published again in detail once they have been re-designed. In the meantime, this section gives some first updated figures for the overall ITR on capital, using the same method of calculation as in earlier editions, but based on the latest national accounts data under the new ESA 2010 system.

## IMPORTANT CAVEATS

It should be noted that the capital tax base components (the denominators of the ITR) are only a rough approximate measure of the worldwide capital income of a country's residents for domestic purposes, and the

ITR denominators may differ from the statutory tax bases defined in legislation for the following reasons:

- Fixed capital depreciation: different prices are used between national vs. profit and loss accounts.
- Consumption of fixed capital: the calculations are not comparable across countries.
- Capital gains are not part of profits in national accounts.
- Central banks: non-taxable profits are included in the denominator.
- There is no separation of interest payments made by households and the self-employed.
- Taxable profits and tax revenues reduced by carryforwards cause cyclical mismatches in the base and in the ITRs distorting international comparisons. Differences between imputed rents on owneroccupied dwellings between national accounts and tax provisions also produce biases.

## THE ESA 2010 CHANGE

This methodological change in the national accounts of the EU $\left({ }^{(14)}\right.$ gave the Member States the opportunity to re-benchmark their national accounts, review their data sources and introduce new or improved ones. As a result, this methodological update led - in most cases - to significantly higher levels of nominal GDP, with an
average growth of 3.7 \% for the EU 28 in 2010 with a breakdown of 2.3 \% due to methodological changes and $1.4 \%$ due to new and improved data sources.

The ESA 2010 change also led to a revision of the income components of GDP, which has had an effect on some of the elements of the ITR on capital. For example, in ESA 95, operating surplus and mixed income accounted for just less than $40 \%$ of GDP for both the EU-28 and the euro area in 2010, while compensation of employees accounted for just under half of GDP. For the same period, the ESA 2010 change increased the proportion of operating surplus and mixed income in both the EU-28 and the euro area by 1.7 percentage points.

## OVERALL IMPLICIT TAX RATE ON CAPITAL

Table 7 shows the overall ITR on capital estimates (ESA 2010 based) for the 1995-2015 period.

## CAPITAL TAX BASE

Table 8 shows estimates of the capital tax base to GDP ratio for the whole 1995-2015 time period using Eurostat data already adjusted to ESA2010 changes. This table shows complete data coverage for 20 Member States and Norway, and partial estimates for Bulgaria, Ireland, Spain, Croatia, Lithuania and Romania. The table does not provide estimates for Malta and Luxembourg due to lack of sector data.

| Description of measure | Change | Date |
| :--- | :--- | :---: |
| Personal income tax: Earned income |  |  |
| Through Income Tax amending law 135(I)/2016 criteria are specified so that |  |  |
| payments to innovative small and medium enterprises can be deducted <br> from taxable income. Any existing provisions are abolished (per law | Base decrease | Legislation: 23-12-2016 |
| abolished benefits were given when there was a purchase of shares, but | In force from: 01-01-2017 |  | individuals).

## Social security contributions: Employer

A law was enacted (76(I)/2016) providing the opportunity to persons who owed unpaid contributions up to and including 31/7/2016, to enter into an agreement with the social insurance services to repay all amounts due as at that date in a maximum of 54 monthly instalments, provided that

Announcement: 01-08-2016
they simultaneously settle their current obligations as they arise during the
Legislation: 01-08-2016 agreed period. Under this Law, if persons opt to pay the amounts due in less than 54 instalments, part of the penalty as at that date can be waived. Special criteria are in place in cases of default. Applications for the use of this scheme could be made between 1/8/2016-30/11/2016.

## Social security contributions: Self-employed

A law was enacted (76(I)/2016) providing the opportunity to persons who owed unpaid contributions up to and including 31/7/2016, to enter into an agreement with the social insurance services to repay all amounts due as at that date in a maximum of 54 monthly instalments, provided that

Announcement: 01-08-2016
they simultaneously settle their current obligations as they arise during the Neutral

Legislation: 01-08-2016 agreed period. Under this Law, if persons opt to pay the amounts due in less than 54 instalments, part of the penalty as at that date can be waived. Special criteria are in place in cases of default. Applications for the use of this scheme could be made between 1/8/2016-30/11/2016.

## Corporate income tax

With Income Tax Amending Law 110(I)/2016 as from 1.7.2016, 80\% of eligible profits from eligible intellectual property that did not produce income or their development was not concluded by 30/6/2016, can be deducted at the option of the taxpayer. Eligible profits/property are specified in regulation 336/2016 published 18/11/2016
Through Income Tax Amending Law 110(I)/2016, costs for the purchase/ development of intellectual property that did not produce income, or where the development was not concluded by 30/6/2016, can be deducted over the life of property up to a maximum of 20 years. The taxpayer can elect for a lesser amount to be deducted in any year.
Value-added tax
Regulation (367/2016) for the compulsory online submission of VAT returns.

Through an administrative decision, farmers and urban taxi drivers under special regime are exempted from compulsory on-line submission.

Announcement: 27-10-2016
Legislation: 01-07-2016
In force from: 01-07-2016

Legislation: 01-07-2016
In force from: 01-07-2016

## Other taxes

Amendment to Immovable Property Tax Law
reducing liability to Immovable Property Tax for the year 2016 to 25 \% of the amount assessed, provided tax was paid by 31/10/2016. If tax was paid between $1 / 11 / 2016$ and $31 / 12 / 2016$ liability is reduced to $27.5 \%$ of the amount assessed and if paid after 2016 a $10 \%$ penalty is added on the reduced liability of $27.5 \%$ of amount assessed. This tax was paid annually and includes all immovable property held as defined irrespective of whether business or residential.

Article 3 of amending law abolishes immovable property tax law as from 1.1.2017.

The Minister of Finance decided not to extend the application of Law on the Special Contribution. Therefore the Law ended on 31.12.2016.

Announcement: 16-12-2016
Legislation: 16-12-2016
In force from: 02-05-2017

Table EE.2: Latest tax reforms

| Description of measure | Change |  |
| :--- | :--- | :--- |
| Personal income tax: Earned income |  | Date |
| Non-payable tax credit for low-income earners. Was abolished from 2017 <br> because tax-free allowance reform (2018) will replace this measure. | Base decrease | Legislation: 30-06-2015 <br> In force from: 01-01-2016 |
| Increase of pensions additional tax-free allowance from EUR 2 700 to EUR <br> 2 832 in a year. Was abolished from 2018 because tax-free allowance reform <br> (2018) will replace this measure. | Base decrease | Legislation: 24-12-2016 |
| Tax-free allowance reform: tax-free allowance is increased from EUR 180 <br> a month to EUR 500 a month. It will start diminishing from income of EUR <br> 1 200 per month to zero at EUR 2 100 a month. There will be fewer costs <br> which can be declared jointly. Pensions additional tax-free allowance will be <br> abolished. Non-payable tax credit for low-income earners will be abolished. | Base decrease | Legislation: 24-12-2016 |
| Reducing housing loan interest deduction limit from EUR 1 200 to EUR 300 <br> per year. | Base increase | In force from: 01-01-2018 |
| Introducing tax exemption on health costs (EUR 100 per worker per quarter). | Base decrease | Legislation: 24-12-2016 <br> In force from: 01-01-2017 |
| Personal income tax: Savings |  | Legislation: 24-12-2016 |
| In force from: 01-01-2018 |  |  |

Table FI.2: Latest tax reforms

| Description of measure | Change | Date |
| :---: | :---: | :---: |
| Personal income tax: Earned income |  |  |
| Full adjustment for inflation to the central government income tax scale. | Base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| As part of a general tax cut on earned income, the lowest and the highest marginal tax rate in the central government income tax scale were lowered. | Rate decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| As part of a general tax cut on earned income, the maximum amount of the earned income tax credit was increased from EUR 1260 per year to EUR 1420 per year. | Base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| The maximum basic deduction in local taxation was increased. | Base decrease | Announcement: 15-09-2016 Legislation: 29-12-2016 In force from: 01-01-2017 |
| Pension income deduction in central government taxation was increased. | Base decrease | $\begin{aligned} & \text { Announcement: 15-09-2016 } \\ & \text { Legislation: 29-12-2016 } \\ & \text { In force from: 01-01-2017 } \end{aligned}$ |
| Pension income deduction in local government taxation was increased. | Base decrease | Announcement: 15-09-2016 Legislation: 29-12-2016 In force from: 01-01-2017 |
| The surtax on pension income was decreased. | Rate decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| As part of a general tax cut on earned income, the standard deduction for work related expenses was increased. | Base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| The tax credit for domestic help or household expenses was increased. | Base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| Personal income tax: Unincorporated businesses/Self employment income |  |  |
| A 5\% entrepreneur deduction was introduced for entrepreneurs and self-employed persons, those engaged in agriculture, forestry or reindeer husbandry, and business partnerships and deemed partnerships. | Base decrease | Announcement: 06-10-2016 Legislation: 21-12-2016 <br> In force from: 01-01-2017 |
| Social security contributions: Employee |  |  |
| As part of the competitiveness pact agreement employees' SSC were increased. | Rate increase; base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| Social security contributions: Employer |  |  |
| As part of the competitiveness pact agreement employers' SSC were increased. | Rate decrease; base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| Value-added tax |  |  |
| Right to use cash based accounting on VAT payments for companies with turnover not more than EUR 500000. | Neutral | Announcement: 15-09-2016 <br> Legislation: 16-12-2016 <br> In force from: 01-01-2017 |
| Environmentally-related taxes |  |  |
| Increase in tax on transport fuels. | Rate increase | Announcement: 15-09-2016 <br> Legislation: 16-12-2016 <br> In force from: 01-01-2017 |
| Increase in energy content tax and CO2 tax on heating fuels. | Rate increase | Announcement: 15-09-2016 Legislation: 16-12-2016 In force from: 01-01-2017 |
| Other excise duties |  |  |
| Abolition of the excise duty on sweets and ice cream. | Base decrease | Announcement: 15-09-2016 <br> Legislation: 29-12-2016 <br> In force from: 01-01-2017 |
| Estate duties/inheritances/gift taxes |  |  |
| Inheritance and gift tax rates of all tax brackets are decreased. Tax rates of I tax class (close relatives) are decreased more than the tax rates of II tax class (other than close relatives). Within the I tax class, tax rates of gift tax are decreased more than the rates of inheritance tax. In addition to decreasing tax rates, certain deductions in inheritance and gift taxation are increased. Abolition of the tax exemption of life insurance compensation paid to close relatives and estate. | Rate decrease; base increase | Announcement: 06-10-2016 Legislation: 21-12-2016 In force from: 01-01-2017 |
| Recurrent taxes on immovable property (business and residential) |  |  |
| Increase in minimum real estate tax rates. | Rate increase | Announcement: 06-10-2016 Legislation: 18-11-2016 In force from: 01-01-2017 |

Table FR.2: Latest tax reforms

| Description of measure | Change |  |
| :--- | :--- | :--- |
| Personal income tax: Earned income |  | Date |
| Introduction of an income tax withholding system. In the current system <br> (until the end of 2017), taxpayers pay their income tax by September for the <br> previous tax year. This reform will introduce a Pay-as-you-earn system. <br> Introduction of an income tax reduction for low earners: the amount of <br> income tax is reduced by 20 \% for taxpayers whose income is below a certain <br> threshold (e.g. EUR 18 500 for a single person). The income tax is unchanged <br> for taxpayers earning more than another threshold (e.g. EUR 20 500 for a <br> single person). A smoothing rule applies for taxpayers between the two <br> thresholds so as to avoid a discontinuity in the tax schedule. | Neutral | Rate decrease |

Figure EL.1: Tax revenues by main taxes, compared to EU-28, 2015 (in \% of total taxation (left graph) and in \% of GDP (right graph))

[^16]Table EL.2: Latest tax reforms

| Description of measure | Change | Date |
| :---: | :---: | :---: |
| Personal income tax: Earned income |  |  |
| Personal income tax on benefit-in-kind provided by company cars. The taxable amount of business operating expenditure on company cars is raised from the current 30 \% to $80 \%$ starting from 2016 incomes. From 2017 incomes onwards the taxable amount will be determined by the retail price of the company car (to be implemented by December 2016, after consultation with Technical Assistance). | Rate increase; base increase | Legislation: 27.5.2016 In force from: For incomes earned from 1.1.2016 onwards |
| Pooling of income. Income from wages, pensions, and business activities will be pooled under a single rate schedule. Farming income will be pooled together with the 1st pillar basic EU subsidies and taxed under the same rate structure separately from wage and business income. | Rate increase; base increase | Legislation: 12.5.2016 In force from: For Income derived 1.1.2016 onwards |
| Definition of farming income. The determination of the profit from business activity for individual farming businesses shall include the basic direct payments under the first pillar of the Common Agricultural Policy and also green and coupled payments in excess of EUR 12000 . The tax credit on farming income will be extended only to those tax - payers who are professional farmers for agricultural subsidy purposes and who derive at least $50 \%$ of their total taxable income from farming activities. | Base increase | Legislation: 12.5.2016 In force from: For Income derived 1.1.2016 onwards |
| The tax rates on pooled business and employment income, as well as on farming income are increased. | Rate increase | Legislation: 12.5.2016 In force from: For Income derived 1.1.2016 onwards |

The tax credit will be available to offset tax on employment income, pension income, and farm income. It will be set at EUR 1900 for a taxpayer without children, EUR 1950 for a taxpayer with one child, EUR 2000 for a taxpayer with two children, and EUR 2100 for taxpayers with 3 or more children. This will bring the average tax-free threshold to around EUR 8750 . The tapering of the tax credit is calculated based on total income from employment, pensions and farming income and will reduce the tax credit at a rate of EUR 10 per EUR 1000 additional income beyond EUR 20000 until the tax credit reaches zero. The maximum allowable offset of the tax credit is the sum of employment, pension, and farm income multiplied by the basic tax rate. Tax credit in excess of this eligible amount cannot be offset
Solidarity surcharge. The legislation for the solidarity surcharge will be included in the Income Tax Code as a separate article. It will be levied on all income, whether subject to Personal income tax or not, including salaries,

Legislation: 12.5.2016 pensions, income from business activity, capital, capital gains and transfers, In force from: For Income derived 1.1.2016 onwards whether real or presumed.

| Health-related taxes | Neutral | Legislation: 12.5.2016 |
| Implement contributions for health coverage of 7.10 \% for employees. | N/A | In force from: 01.01.2017 |

## Other excise duties

Fuel excises: from 1st June 2016, natural gas used for electricity production
is exempt from the excise duty, from 1st of January 2017 Reduce Excise Duty
Rate decrease; base decrease
on Natural Gas for households and production
Fuel excises: from 15.10.2016, raise the excise duty on heating fuel (diesel and kerosene) from EUR 230 to EUR 280 per 1000 litres.
Rate decrease; base decrease
Rate increase; base increase

Legislation: 27.5.2016
In force from: 1.6.2016 ; 1.1.2017

Fuel excises: from 1.1.2017, raise the excise duty on petrol from EUR 670 to
EUR 700 per 1000 litres; on diesel from EUR 330 to EUR 410 per 1000 litres, on kerosene from EUR 330 to EUR 410 per 1000 litres, and on motor LPG from EUR 330 to EUR 430 per 1000 Kgr . From 1.1.2017, reduce the excise duty on natural gas for heating in non-businesses (i.e. residential) from EUR 5.4/MWh (EUR 1.5/GJ) to EUR 1.07/MWh (EUR 0.3/GJ).

Effective 1 January 2017: revision of the excise tax rates on natural gas for industrial/commercial (non-heating) use, with the new rates ( $€ / \mathrm{MWh}$ ) based on consumption.
Dodecanese reduced rate on alcohol excises: the current $50 \%$ reduction of excise duties on alcoholic beverages in the Dodecanese islands will be removed from 1.1.2018.
Excise duty on beer: the excise duty on beer will be increased from EUR 2.6 per 100 litres to EUR 5 per 100 litres. The reduced rate for small independent breweries will be increased from EUR 1.3 to EUR 2.5.

Legislation: 27.5.2016
In force from: 1.6.2016

Excise tax rates on cigarettes and tobacco: the excise tax regime on
cigarettes will be restructured from 1.1.2017 by increasing the ad valorem excise from $20 \%$ to $26 \%$ of the retail selling price. The specific tax on fine cut smoking tobacco will be increased from EUR 156.70 to EUR 170 per kg.
Consumption tax on e-cigarettes: a new tax of 10 cents/ml will be introduced on e-cigarettes from 1.1.2017.

Legislation: 27.5.2016
In force from: 1.1.2017
Rate increase; base increase

Legislation: 27.5.2016
In force from: 1.1.2017

Figure IT.1: Tax revenues by main taxes, compared to EU-28, 2015 (in \% of total taxation (left graph) and in \% of GDP (right graph))

[^18]Table IT.2: Latest tax reforms

| Description of measure | Change | Date |
| :---: | :---: | :---: |
| Personal income tax: Earned income |  |  |
| Individuals newly resident, (having not been resident in Italy during the previous 9 years), as concerns foreign income, can opt for a lump sum substitute tax of EUR 100000 for every tax period. | Neutral | Legislation: 11-12-2016 <br> In force from: 01-01-2017 |
| Personal income tax: Unincorporated businesses/Self employment income |  |  |
| Introduction of a substitute 24 \% proportional tax rate, (named IRI) equal to CIT rate, applied to SMEs, partnerships, sole proprietorships, self-employed workers, artisans and professionals on re-invested income. Otherwise, income withdrawn is taxed at ordinary PIT rates. | New tax | Legislation: 11-12-2016 <br> In force from: 01-01-2017 |
| Value-added tax |  |  |
| Regarding VAT operations, the measure foresees several periodic data transmissions in the tax period according to an established timetable. The Revenue Agency can perform its check activity on the basis of this information regardless of VAT returns submission. | Base increase | Legislation: 22-10-2016 <br> In force from: 01-01-2017 |
| The measure foresees that legally autonomous entities may constitute a group as a single VAT taxpayer. Those involved must have economic and organizational relationships and mainly a common control by direct or indirect participation. This implies that transactions within the VAT group are excluded from the scope of VAT. | Base decrease | Legislation: 11-12-2016 <br> In force from: 01-01-2018 |
| Other taxes |  |  |
| Decrease of ACE return rate from 4.75 \% to 2.3 \% in 2017 and 2.7 \% in 2018. | Neutral | Legislation: 11-12-2016 In force from: 01-01-2017 |
| RD Tax Credit has been extended up to 2020. As from 2017, the tax credit amount has been increased from $25 \%$ to $50 \%$ of the costs increase compared to the average of the RD investments of the three previous tax periods. The annual allowance threshold has been increased from EUR 5 million to EUR 20 million. | Base decrease | Legislation: 11-12-2016 <br> In force from: 01-01-2017 |
| The $40 \%$ increase in deductible investment costs for new tangible assets has been extended up to 30.6 .2018 and expanded to include certain intangible assets (software). Moreover, a 150 \% increase in investment costs relating to innovative instruments has been approved. | Base decrease | Legislation: 11-12-2016 <br> In force from: 01-01-2017 |

| The tax allowance for home purchase savings plans for young taxpayers (under 40 years old), will be doubled from EUR 672 to EUR 1344. | Base decrease | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| Social security contributions: Employer |  |  |
| Low decrease of the contribution rates of the Employers' Mutual insurance, an insurance against salary costs incurred as a result of the salary continuance in the case of illness that was introduced in 2009. The contribution rates are re-fixed every year according to the financial absenteeism rate of the employers. Employers are classified in one of the four classes according to their financial absenteeism rate. For 2016, the contribution rates are: $0.46 \%$ for class1, $1.21 \%$ for class $2,1.85 \%$ for class 3 and $2.93 \%$ for class 4 . The average rate is $2.0 \%$ in 2016 compared to $2.03 \%$ in 2015. | Rate decrease; base increase | Announcement: 18-12-2015 <br> Legislation: 18-12-2015 <br> In force from: 01-01-2016 |
| Corporate income tax |  |  |
| Reduction of the CIT from 21 \% to 19 \% in 2017 and to 18 \% in 2018. For companies with a taxable income not exceeding EUR 25000 , the CIT rate is set at $15 \%$. For taxable income ranging between EUR 25000 and EUR 30000 , the CIT rate is set at EUR 3750 plus $33 \%$ ( $39 \%$ for 2017) of the taxable income exceeding EUR 25 000. The CIT rate is set at 18 \% ( $19 \%$ for 2017), if taxable income exceeds EUR 30000. | Rate decrease | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| The minimum wealth tax on SOPARFI is increased from EUR 3210 to EUR 4815. | Rate increase | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| Other corporate taxes |  |  |
| Losses incurred from 2017 onwards can be carried forward for 17 years (no longer indefinitely). | Base increase | Announcement: 29-02-2016 Legislation: 23-12-2016 In force from: 01-01-2017 |
| Capital gains derived from the transmission of businesses can benefit, under certain conditions, from a tax deferral. | Base decrease | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| The tax credit for investments is increased. The complementary tax credit for investments is increased from $12 \%$ to $13 \%$. The global tax credit for investments is increased from $7 \%$ to $8 \%$. | Base decrease | Announcement: 29-02-2016 Legislation: 23-12-2016 In force from: 01-01-2017 |
| Environmentally-related taxes |  |  |
| A EUR 5000 tax allowance will be granted for the purchase of an electric or hydrogen-powered car. The tax allowance is EUR 300 for the purchase of a pedelec or bicycle. | New tax | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| In case of a car lease granted by the employer to the employee, the taxation will be based on the valuation of the benefit in kind increased by a progressive rate depending on the amount of CO 2 emitted. The rate ranges from $0.5 \%(0 \mathrm{~g} \mathrm{CO} 2 / \mathrm{km})$ to $1.7 \%$ (petrol cars with CO2 emissions $>150 \mathrm{~g} / \mathrm{km}$ ), respectively $1.8 \%$ (diesel cars with CO2 emissions > 150g/km). | Rate increase | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| Other excise duties |  |  |
| Tax adjustment (cigarettes and fine cut tobacco). | Rate increase; base increase | Announcement: 24-01-2017 Legislation: 24-01-2017 In force from: 01-02-2017 |
| Other taxes |  |  |
| In the context of agricultural income, the tax allowance for investment is fixed at $30 \%$ for the first investment bracket up to EUR 250000 and at $20 \%$ for the second investment bracket exceeding EUR 250000. | Base decrease | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |
| Fight against tax fraud, for instance: higher administrative fines, enhancement of criminal investigation department, mandatory regular book-keeping for liberal professions, extension of the cooperation between the judicial authorities for the spontaneous exchange of tax related information. | New tax | Announcement: 29-02-2016 <br> Legislation: 23-12-2016 <br> In force from: 01-01-2017 |

[^20]Table PL.2: Latest tax reforms

| Description of measure | Change | Date |
| :---: | :---: | :---: |
| Personal income tax: Earned income |  |  |
| Modification of the tax-free amount. It will be higher for low-income (up to PLN 11000 per year) taxpayers and lower for the high-income (over PLN 85528 per year) taxpayers. | Base decrease | Legislation: 29-11-2016 <br> In force from: 01-01-2017 |
| Personal income tax: Unincorporated businesses/Self employment income |  |  |
| Introduction of a new optional rate of a lump-sum tax (2 \%) on revenues gained from sale of processed vegetal and animal products (not processed in an industrial way) | New tax | Announcement: 2015 <br> Legislation: 09-04-2015 <br> In force from: 01-01-2016 |
| Introduction of a tax exemption in the amount of PLN 20000 of revenues gained from sale of processed vegetal and animal products (not processed in an industrial way) | Base decrease | Announcement: 2016 Legislation: 16-11-2016 In force from: 01-01-2017 |
| Enlargement of R\&D tax relief; introduction of the possibility to claim a cash payment of the amount of qualified expenditure which cannot be deducted because of insufficient taxable income; exclusion from the revenue of the nominal value of shares in the case of commercialization of intellectual property. | Base decrease | Announcement: 2016 Legislation: 04-11-2016 In force from: 01-01-2017 |
| Increase of the limit of revenues (from EUR 150000 to EUR 250 000) which entitles taxpayers to choose simplified form of personal income taxation - a lump-sum tax on evidenced revenues. | Neutral | Announcement: 2016 Legislation: 16-12-2016 In force from: 01-01-2017 |
| Corporate income tax |  |  |
| The Act of 5 September 2016 amending the law on income tax from natural persons and legal persons income tax Act reduced the corporate income tax rate to the $15 \%$ for small taxpayers (i.e. taxpayers with sales revenues not exceeding 1.2 million the equivalent of euro in the previous tax year and for new taxpayers - under conditions laid down in the law ) or newly started taxpayers (in the year in which they initiated business activity). | Rate decrease | Legislation: 05-09-2016 <br> In force from: 01-01-2017 |
| The Act of 13 April 2016 amending the law on income tax from natural persons and legal persons income tax Act and the Act on freedom of economic activity introduced (in 2017) regulations providing for exclusion from tax deductible costs payments related to transactions, that were not conducted in line with an obligation to make the payment via a payment (bank) account if the value of the transaction exceeded PLN 15000 | Base increase | Legislation: 13-04-2016 <br> In force from: 01-01-2017 |
| The Law of 4 November 2016 amending certain laws defining the conditions for business to innovate: <br> - increased the level of the tax deduction from a tax basis for costs incurred for R\&D activity, <br> - extended the list of eligible costs by adding the costs of patents as well as rights to inventory and industrial designs incurred by SMEs, <br> - made the tax deduction refundable (under conditions laid down in the | Base decrease | Legislation: 04-11-2016 <br> In force from: 01-01-2017 | law),

- abolished taxation from the revenue of the nominal value of shares in the case of commercialization of intellectual property by qualified taxpayers (e.g. educational and research institutions).

Value-added tax
Extending the application of $0 \%$ VAT rate for the supply and import of

Legislation: 04-11-2016
In force from: 01-01-2017
vessels used for navigation on the high seas and carrying passengers for reward or used for the purpose of commercial, industrial or fishing activities, or for rescue or assistance at sea, or for inshore fishing and for import parts and equipment for these vessels.
Introduction of the joint and several liability of taxpayer representative (max. 500000 PLN) for tax arrears arising in the first 6 months of taxpayer's activity if the tax arrears are a result of fraudulent activity.
Extension of the scope of reverse charge mechanism to processors (single economic transaction exceeding the limit of PLN 20000 (circa EUR 5 000), certain gold, silver and platinum products.

Announcement: 10-08-2016
Legislation: 06-07-2016
In force from: 01-01-2017

Introduction of penalties of $30 \%$ ( $20 \%$ ) for VAT underestimation or 100 $\%$ for VAT underestimation if taxpayer is found to have participated in fraudulent transactions (carousel fraud). Taxpayers will not be punished if they voluntarily correct their VAT return before a tax audit commences. VAT arrears resulting from accounting errors will not be punished, nor will arrears
from reporting VAT in the wrong periods.

Announcement: 15-12-2016
Legislation: 01-12-2016
In force from: 01-01-2017
Announcement: 15-12-2016
Legislation: 01-12-2016
In force from: 01-01-2017

[^23]Table SI.2: Latest tax reforms

| Description of measure | Change | Date |
| :--- | :---: | :---: |
| Personal income tax: Earned income |  |  |

(1) Change of the income tax scale, which brings an overall burden reduction for all taxpayers with income above 1.6 times the average wage in Slovenia (between current 2nd and 3rd tax brackets a new tax bracket is introduced at the net tax base of EUR 48000 and with a rate of $34 \%$, while the rate of a personal income tax for the 4th bracket is reduced from 41 \% to $39 \%$. (2) An increase in income threshold for eligibility for a higher additional general tax relief, namely an increase of EUR 300 from the current EUR 10866.37 to EUR 11166.37 of the total active income per taxpayer. (3) Income paid as a reward for performance is exempt from income tax (but not from social security contributions), but only up to $70 \%$ of the last known average monthly wage in the Republic of Slovenia.

[^79]
## Annex B: Methodology and explanatory notes

The 'Taxation trends' survey assesses the tax system from a number of angles. The examination of the tax structures by tax type and by level of government illustrates the relative importance of the different tax instruments used in raising revenues and the distribution of autonomous financial resources among the constituent elements of the state apparatus, respectively. The breakdown into taxes on consumption, labour and capital allows an assessment of the manner in which the tax burden is distributed among the different factors. In addition, environmental taxes and property taxes are specifically examined, as they are subject to increased attention/ scrutiny/special focus. The implicit tax rates measure in turn the actual or effective average tax burden levied on different types of economic income or activities.

This methodological note explains the methods of, and the reasoning behind, the calculation of the various ratios presented in the survey; approaching them in the order in which they appear in each country table in Part II and in the tables in the Annex A of the report. Given that Parts A and B (Tax structure by tax type and Tax structure by level of government) follow ESA 2010 classifications ( ${ }^{( }$), a simple description of the aggregates and the data sources is provided. Parts C to E (Tax structure by economic function, Environmental and Property Taxes) and Part F (Implicit tax rates) present statistics developed by the European Commission Directorate-General for Taxation and Customs Union specifically for this publication, so the reasoning will be delved into in greater detail, with attention given to both their theoretical and practical limitations. This note concludes with an in-depth discussion of the approaches used in calculating the split of personal income tax according to its sources, a process critical to the creation of meaningful statistics for Parts $C$ and $F$.

## Data sources

The primary cut-off date for most of the data in this report was 24 November 2016. This concerns the National Accounts data and the more disaggregated tax data submitted to Eurostat (the National Tax List or NTL) which were used for the classification of revenue according to economic functions and to determine the level of environmental and property taxes. In very few cases, estimates at the detailed level have been used if statistics were not available; in those cases, the estimates were either supplied by Member States administrations or computed using proxies.

Although all Member States authorities have provided disaggregated data on their tax revenue (the National Tax List), their level of detail varies. Information on the level of disaggregation used for the computation of

[^80]the indicators for each Member State can be found on the web pages of the Directorate-General for Taxation and Customs Union as well as on Eurostat's 'Statistics Explained' page. While the former presents data as it was used in the calculations of the report, the latter is continuously updated along with updated National Accounts transmissions.

## Data coverage

This publication presents time series of tax revenue (including taxes levied on behalf of the institutions of the European Union) and tax rates for the twenty-eight Member States, Norway and Iceland. The seven EU outermost regions - Martinique, Guadeloupe, French Guiana and Réunion, Saint-Barthélemy, Saint-Martin, Madeira, the Azores and the Canary Islands - are covered in the tables presenting tax revenue data. However, they are not covered in the tables presenting tax rates.

Data coverage and reliability have generally improved over time. The coverage of the implicit tax rate on capital is, however, patchy as the computation is quite demanding in terms of the required level of detail in national accounts data. For this and other reasons, the comprehensive calculation of the ITR on capital has been temporarily suspended, but work is in progress to update the indicator in the near future. Nevertheless, some indicative figures for the overall ITR on capital using the old methodology applied to ESA 2010 data are given in Part 1 along with some short notes regarding the limitations of the indicator.

## Ranking

In all the tables of Annex A, a ranking is given whereby the Member State with the highest ratio is listed with number 1 , the second with number 2 and so on. The ranking refers to the order of the Member States for each specific ratio and only includes those Member States for which 2015 data are available in the respective table. The rankings are also shown in the country tables in Part II of the report. No ranking is given if more than $10 \%$ of data points are missing.

## Averages

This report computes weighted averages for two groups of countries: the EU as a whole (EU-28) and the euro area (EA-19). Occasionally, averages for other groupings (the former EU-15, the NMS-, etc.) may be used for illustrative purposes. The average computed for the taxes received by the State Government refers to the Länder in Austria and Germany, the gewesten en gemeenschappen / régions et communautés in Belgium and comunidades autónomas in Spain. The EU
aggregates for state government and social security funds are calculated over all Member States.

## Ratios to GDP

Throughout the report many revenue indicators are presented as a percentage of GDP. The GDP data used for the report was downloaded from Eurostat's database on 29 November 2016. It should be noted that for Ireland there was a very significant growth in GDP in 2015 primarily due to the relocation to Ireland of a limited number of big economic operators. This also had slight upwards effect on EU and euro area GDP aggregates.

## Totals, shares and "amounts assessed but unlikely to be collected"

For some countries the sum of the taxes in percentage of GDP in each of the Parts $A$ and $C$ of the country chapters data table and in the corresponding Annex A tables adds up to more than the total - equivalently the sum of taxes in percentage of total taxation adds up to more than $100 \%$ for those countries. This is the case whenever the table contains the item 'Capital transfers (representing taxes assessed but unlikely to be collected)' (ESA code D.995). For the countries that (partially) use the assessment method of accrual recording (see below), a capital transfer can be recorded from general government to other sectors of the economy. This represents taxes and social contributions assessed but unlikely to be collected (D.995), which have to be deducted from tax revenue in order to produce consistent data with countries that use the timeadjusted cash method or that combine a method based on assessments and declarations with coefficients.

Table 27 of Annex A lists the countries for which this is the case (and the magnitude of this item as a share of GDP). Less than $100 \%$ may also be reported for countries reporting taxes on labour in the sector "EU institutions" (Belgium and Portugal).

According to ESA, taxes and social contributions should be recorded on an accrual basis. Two methods can be used:
a) 'time-adjusted' cash - the cash is attributed to when the activity took place to generate the tax liability or when the amount of taxes was determined in the case
of some income taxes. This adjustment may be based on the average time difference between the activity and cash receipt;
b) a method based on declarations and assessments. In this case, an adjustment needs to be made for amounts assessed or declared but unlikely to be collected. These amounts have to be eliminated from government revenue, either by using a tax-specific coefficient based on past experience and future expectations or by recording a capital transfer for the same adjustment (ESA 2010 code D.995) to the relevant sectors.
D. 995 should be taken into account when analysing the data for the concerned countries, especially in cross-country comparison as the components of tax revenue are overstated when compared to countries using a time-adjusted cash method or a method based on assessments and declarations but with a coefficient representing taxes unlikely to be collected directly on each tax revenue item. Where it occurs, the proportional bias is on average equal to ( $1+$ D995 expressed as a percentage of total taxation).

Sums by economic function do not add up for Belgium and Portugal due to the non-inclusion of taxes - other than own resources - paid to EU institutions.

## Payable Tax Credits

A further issue concerning the measurement of tax revenues relates to the treatment of 'payable' tax credits. 'Payable tax credits' are credited against a tax liability, and only need to be paid out to beneficiaries if they exceed the tax liability. A payable tax credit can be conceptually split into two components: one component (the 'tax expenditure component') is used to decrease the tax liability, and the other (the 'transfer component') is the remainder left over if the total tax credit amount exceeds the tax liability, and is paid directly to a recipient as a benefit payment.

A dedicated section on this subject can be found in Part 1. The effects on tax indicators of the two methods of treating payable tax credits - the 'gross' approach and the 'split' approach - are estimated in this section. The data used in this section come predominantly from Eurostat, but in one or two cases OECD/national finance ministry data may be cited. Payable tax credit data can also be found in section $G$ of the country tables (see Part 2 of the report).

## Part A: Tax structure by tax type

## Definitions

'Total taxes (including compulsory actual social contributions)' are defined in this report as: taxes on production and imports (D.2), current taxes on income and wealth (D.5), capital taxes (D.91), compulsory actual social contributions (D.611C + D.613C). Indirect taxes, direct taxes and social contributions add up to the total of taxes and compulsory actual social contributions received by the general government and the institutions of the European Union.
'Taxes (excluding social contributions)'are defined as 'total taxes (including compulsory actual social contributions)' minus actual compulsory social contributions.
'Indirect taxes' are defined in this report as taxes linked to production and imports (code D. 2 in the ESA2010 system), i.e. as compulsory levies on producer units in respect of the production or importation of goods and services or the use of factors of production. They include VAT, import duties, excise duties and other specific taxes on services (transport, insurance etc.) and on financial and capital transactions. They also include taxes on production (D.29) defined as 'taxes that enterprises incur as a result of engaging in production', such as professional licences, taxes on land and building and payroll taxes.

Indirect taxes are defined as the sum of the following ESA2010 tax categories:

- VAT: value added type taxes (D.211).
- Taxes and duties on imports excluding VAT (D.212).
- Taxes on products, except VAT and import duties (D214).
- Other taxes on production (D.29).
'Direct taxes' are defined as current taxes on income and wealth (D.5) plus capital taxes including taxes such as inheritance or gift taxes (D.91). Income tax (D.51) is a subcategory, which includes personal income tax (PIT) and corporate income tax (CIT) as well as capital gains taxes.

Direct taxes are defined as the sum of the following ESA categories:

- personal income tax:taxes on individual or households income including holding gains (D.51A + D.51C1);
- corporate income tax: taxes on the income or profits of corporations including holding gains (D.51B + D.51C2);
- other income and capital taxes: other taxes on income corresponding to other taxes on holding gains
(D.51C3), taxes on winnings from lottery or gambling (D.51D) and other taxes on income n.e.c. (D.51E); taxes on capital defined as other current taxes (D.59) and capital taxes (D.91).
'Actual compulsory social contributions' are paid by employers and employees on the basis of a work contract, or by self- and non-employed persons. They can be split into three subcategories:
- compulsory employers' actual social contributions (D.611C);
- compulsory employees'social contributions (D.613CE);
- compulsory social contributions by self- and nonemployed persons (D.613CS and D.613CN).

## Different indicators of tax burden

Some indicators of tax burden take into account all actual social contributions (for example, ESA2010 code D.611), which include both compulsory and voluntary contributions. Voluntary contributions vary in their purpose (e.g. the purchase of 'extra years' for pensions and the wish to complete a gap in the social contributions due to years worked abroad) and may vary in the degree to which they are voluntary in a real economic sense. In addition, employers' imputed social contributions' (D.612), which relate to unfunded social security schemes, are excluded from the indicators in this report. Two other items - households' social contribution supplements (D.614) and social insurance scheme service charges (D.61SC) - are also excluded. Households' social contribution supplements (D.614) and social insurance scheme service charges (D.61SC) represent respectively the property income attributable to social insurance policy holders, which is reinvested in the scheme and the output (administrative cost) of operating the social insurance scheme. In both cases, there are counterpart entries in the national accounts. These items are only non-zero when there are definedbenefit or defined-contribution social insurance schemes (funded schemes) classified in general government. A noticeable but small impact of these items is only present for Belgium and Sweden.

The definition employed in this report thus corresponds to Indicator 2 of the four indicators of general government and European Union levies issued by Eurostat (see Box A.1).

Graph A.1: Sensitivity analysis: role of imputed social contributions and voluntary actual social contributions, 2015 (\% of GDP)

Source: DG Taxation and Customs Union, based on Eurostat data

In practice, imputed social contributions relate to governments, which do not pay actual contributions for their employees but nevertheless guarantee them a pension upon retirement; imputed social contributions represent the contributions the government should pay to a pension fund in order to provide a pension of an equivalent amount to its employees. Imputed social contributions are not therefore based on actual transactions. Including imputed social contributions in the definition of compulsory levies would allow greater comparability over time and across countries, given that some governments make actual contributions for their
employees while others simply pay social benefits to their employees as their entitlement arises. Ultimately it is found that, while including imputed social contributions (along with households' social contribution supplements and social insurance scheme service charges) in the definition of total taxes would result in a non-negligible level shift, yielding an increase of the tax ratio for the EU-28 average of around 1.23 percentage points (see Graph A.1), the development of the ratios over time remain relatively stable. The inclusion of imputed social contributions does however result in a different ranking of Member States by the size of their tax burden.

Box A.1: Indicators of general government and European Union levies

In 2001, the Eurostat National Accounts Working Group defined four taxation indicators for general government and European Union levies, progressing from a narrower to a broader definition:

## Taxes on production and imports (D.2)

+ Current taxes on income, wealth, etc (D.5)
+ Capital taxes (D.91)
[- Capital transfers from general government to relevant sectors representing taxes and social contributions assessed but unlikely to be collected (D.995)]
+ Compulsory actual social contributions (D.611C+D613C) payable to the social security funds sub-sector (S.1314)
$=$ INDICATOR 1 (Total taxes and compulsory social security contributions)
+ Compulsory actual social contributions (D.611C+D613C) payable to the central government (S.1311), state government (S.1312), and local government (S.1313) sub-sectors as employers
$=$ INDICATOR 2 (Total taxes and compulsory actual social contributions payable to general government, including those for government as an employer)
+ Imputed social contributions (D.612) payable to general government as an employer
+ Households' social contribution supplements (D.614)
- Social insurance scheme service charges (D.61SC)
$=$ INDICATOR 3 (Total taxes and compulsory social contributions payable to general government, including those for government as an employer)
+ Voluntary actual social contributions payable to the general government sector (S.13) (D.611V+D.613V)
$=$ INDICATOR 4 (Total taxes and social contributions payable to general government, including voluntary contributions)

## Source: Eurostat

For the purposes of this report, voluntary actual social contributions are assumed to be zero, whenever they cannot be distinguished from compulsory contributions.

It should also be noted that in some countries nontax compulsory payments may be made to private funds or schemes outside general government and that these are not included in the indicators of tax
burden. However, it should be noted that compulsory, unrequited (something-for-nothing) payments can only be received by general government (or EU institutions in some cases), necessitating a rerouting through general government in certain cases, which fulfils the national accounts purpose of bringing out the economic substance of economic transactions.

## Part B: Tax structure by level of government

## Definitions

'Total taxes received by the general government and the institutions of the EU' (institutional sector S.13_S. 212 in ESA2010) are broken down as taxes received by:

- central government (S.1311);
- state (region) government for federal states (S.1312), only applicable for Belgium, Germany, Spain and Austria;
- local government (S.1313);
- social security funds (S.1314), not applicable for Ireland, Malta, the United Kingdom and Norway (please see below);
- EU institutions (S.212).

The amount of first and second own resources recorded in the accounts of the EU institutions for a particular country is influenced by its geographic location and its infra-structure (e.g. large ports). This affects the overall tax burden, the level of indirect taxation and the level of taxes on consumption. In addition, Belgium and Portugal report some revenues for PIT and social contributions for the EU institutions (excluded from taxes by economic function).

It should be understood that data on tax revenues collected should be used with some caution in the context of analysing the issue of government centralisation or decentralisation. In particular, the breakdown by level of government may be different depending on whether one looks at tax receipts data or government expenditure data.

The organisation of the tax system may also have an effect on this breakdown: for example in Estonia the
institutional structure dealing with pension contributions is part of central government, which partly explains the comparatively low share of the social security funds subsector.

## Country specific information

In Hungary, since 2008, total personal income tax (D.51A+D.51C1) for the local government (S.1313) is accounted for by the general government (S.1311) and after transferred under D. 7 to S.1313. This method of recording results in a lower estimate of local government tax revenue since 2008 compared with those for the period up to 2007.

For Belgium, two alternative allocations of tax revenue by sub-sector are shown: 'ultimately received tax revenues' and tax revenues as transmitted under ESA2010 rules to Eurostat. For the purpose of compiling the EU and euro area aggregates, the National Accounts definition is used. For Belgium use is made of additional data (Belgostat / BNB: current transfer of fiscal receipts withheld to fund other sub-sectors (see https://stat.nbb. be/) in order to provide "ultimately received taxes" by sub-sectors of general government.

In Estonia the figure for local government includes only land tax and other local taxes. However, local governments receive $70 \%$ of personal income tax receipts (in addition to the 1.1 \% share of revenues) as a transfer from central government. Personal income tax is classified under central government as local governments do not set the rate.

## Part C: Tax structure by type of tax base

## Data sources

The calculation of Part $C$ ratios is done on the basis of specific assumptions and more detailed revenue data than the one published by Eurostat. Eurostat supplements its database by a so-called National Tax List supplied by Member States to Eurostat. The allocation of taxes to a tax-base category (consumption, labour, capital), also called the 'economic function code', is applied to each tax contained in the National Tax List.

The detailed revenue data and the economic function code allocation for each country and each tax are available on the "Economic Analysis' website of the Directorate-General for Taxation and Customs Union.

In addition to the supplementary data, some specific splits/allocations have been assumed:

- A split of the personal income tax to four subgroups is used.
- Compulsory social contributions of the nonemployed (considered as part of labour) and the self-employed (considered as part of capital), if not provided separately as D.613CS and D.613CN, are split using estimated shares.

For some countries the split is either directly available in the National Tax List or provided by Member States' authorities. Where no statistics were available, the share paid by the non-employed was assumed to be negligible.

## Methodology and breakdown of taxes by type of tax base

Taxes on consumption, labour and capital add up to the total of taxes received by general government ( ${ }^{(2)}$. The separation of taxes by type of tax base inevitably leads to simplifications and somewhat hybrid categories. A number of borderline cases and approximations had to be taken into account to arrive at a final classification of taxes. Tax data are not always recorded in sufficient detail to identify individual taxes and allocate them to the corresponding tax base categories. In addition, some specific national features required a special treatment. The degree of decomposition provided by national statistical offices makes it sometimes difficult to identify sub-categories. General guidelines for the allocation of the taxes are given in the following Boxes C. 1 to C.5. However, exceptions are made if necessary to reflect the true nature of a tax. Borderline cases, which mainly regard the split between taxes on stocks of capital and on consumption, are discussed with Member States.

A key methodological problem for classifying tax by type of tax base is that some taxes relate to multiple sources of income. This holds most notably for the personal income tax. Therefore, a method was developed to break down personal income tax revenue, in most cases using unpublished data supplied by the national tax administrations. A breakdown of the personal income tax according to four sources of taxable income (labour, capital, self-employment income, and social transfers and pensions) is carried out by Member States' authorities according to a country specific methodology (the so-called 'PIT split'). Member States use data sets of individual taxpayers (Belgium, Denmark, Germany, France, Ireland, Luxembourg, Latvia, Malta, Netherlands, Poland, Finland, Sweden, Slovenia and United Kingdom) or income class data based on the data set of individual taxpayers (Cyprus, Greece, Spain, Italy, Lithuania, Bulgaria) or tax receipts from withholding and income

[^81]tax statistics with certain corrections (Czech Republic, Estonia, Hungary, Austria, Portugal, Romania) (3).

Several Member States were not able to provide full time-series coverage for all calendar years. In these cases a trend has been assumed using simple linear interpolations or the fractions were assumed to remain constant, i.e. the 2015 split was considered equal to that of 2014. Tables F. 1 to F. 4 give all the details of the PITsplit provided by each Member State. In some cases the number of estimates for the PIT split still falls short of the ideal, which to a limited extent affects the accuracy of the distribution of taxes by type of tax base and, therefore, of the implicit tax rates (ITRs). Additional details are given in a later section of this methodological note.

Although, as a rule, taxes are classified under one single category of tax base, in some specific cases a breakdown of revenue has been carried out also for taxes other than the PIT. For example, local business taxes often relate to one or more sources of economic income and are allocated over the different categories of tax base where possible. In those cases, examples of which are mentioned below, estimates from Member States have been used to distribute their revenue across the different groups of tax base.

- The revenue from the French tax on types of accommodation (so-called Taxe d'habitation), for example, has been distributed among the categories 'consumption' and '(stocks of) capital', using estimates from the national administration. Note that the most appropriate economic function for this tax is currently being investigated by the French National Statistical Office, INSEE.
- The revenue from the Italian Regional tax on Productive Activities (IRAP), for example, has been distributed among the categories 'labour' and 'capital', using data communicated by the Ministry of Finance. The tax is charged on Public Administrations (state, regions, municipalities, etc.), corporations, partnerships, self-employment and non-commercial bodies. The tax base is the difference between items classified in the production value and items classified in the production cost, as defined in the Civil Code. For the Public Administrations, the tax base is equal to the total employees' compensation and, therefore, fully attributed to the 'employed labour' component. The part paid by the private bodies is divided between labour and capital by estimating the labour cost from data provided by withholding agents in the tax returns and further calculating the production value net of the estimated labour cost, thus determining the capital share of IRAP.

[^82]- The French local business tax (Taxe professionnelle) has been fully allocated to the category 'Stocks of capital', as it is mostly levied on buildings and real estate, and the French government reformed the tax with phasing out the payroll component from the tax base.

In Italy, the earnings and the compulsory social contributions paid by self-employed persons working under the so called 'co.co.co' regime (coordinated and continuous collaboration, special work regime now abolished and substituted by project collaboration) are transferred from the category 'capital (income of self-employed)' to 'labour' (partly to employers and employees).

## Taxes on consumption

Taxes on consumption are defined as taxes levied on transactions between final consumers and producers and on the final consumption goods. In the ESA classification these can be identified as the following categories (see Box C.1).

- Value added-type taxes (D.211).
- Taxes and duties on imports excluding VAT (D.212).
- Taxes on products except VAT and import duties (D.214), which include excise duties. Those taxes paid by companies on products used for production have been excluded from the category of consumption taxes, whenever the level of detail enabled their
identification ( ${ }^{4}$ ). Some categories have been allocated to capital such as the stamp taxes (D.214B), when they could be identified as related to the stock exchange market or real estate investment. Taxes on financial and capital transactions (D.214C) as well as some export duties and monetary compensatory amounts on exports (D.214K) have also been recorded as capital taxes.
- Other taxes on production (D.29). These are typical borderline cases since this category includes several taxes or professional licences paid by companies 'as a result of engaging in production'. Total wage bill and payroll taxes (D.29C) have been classified as a tax on labour; taxes on land, building and other structures (D.29A) have, been classified as taxes on the stock of capital. However, taxes on international transactions (D.29D), taxes on pollution (D.29F) and the undercompensation of VAT (flat-rate system) (D.29G) have been considered as consumption taxes.

Some taxes defined as current taxes (D.5) in ESA2010 such as poll taxes, expenditure taxes, or payments by households for licences have been attributed to consumption since they are expenditures made by households to obtain specific goods and services.

[^83]
## Box C.1: Definition of taxes on consumption

    D.59D Payments by households for licences
```

## Taxes on labour

## TAXES ON EMPLOYED LABOUR INCOME

Taxes on employed labour comprise all taxes, directly linked to wages and mostly withheld at source, paid by employers and employees, including actual compulsory social contributions (see Box C.2). They include compulsory actual employers' social contributions (D.611C) and payroll taxes (D.29C), compulsory social contributions paid by employees (D.613CE) and the part of personal income $\operatorname{tax}(\mathrm{D} .51 \mathrm{~A})$ that is related to earned income. The personal income tax is typically levied on different sources of income: labour income, but also social benefits, including pensions, dividend and interest income and self-employment income. The notes in Part F explain how taxpayers' data have been used to allocate the personal income tax revenue across different sources of income

Under the definition of taxes on employed labour income adopted in this report, the categories 'personal income tax' and 'social contributions' are used in a wide sense including all other taxes that are susceptible of increasing the cost of labour. Therefore, the recorded amount of 'personal income tax' in the Nordic countries not only consists of central government income tax, but also includes the state income tax, or municipality income tax and sometimes also church tax. In France, the generalised social contribution (CSG) and the contribution for the reduction in the debt of the social
security institutions (CRDS) are partially booked as income tax on labour income. In Austria, the 'contributions to chambers' and the 'promotion residential building' are also partially booked as tax on labour income. In Hungary, the communal tax on enterprises is allocated to labour as 'employers' social contributions and payroll tax'. In Italy, part of the revenue from the IRAP tax, which is levied on a measure of value added by enterprises, has been allocated to labour and 'employers' social contributions' in particular (and also included in the denominator of the tax ratio). In Belgium and Portugal, personal income taxes and social contributions paid by EU civil servants to the EU Institutions were excluded from the calculations of labour taxes although they are included in total tax revenues.

## TAXES ON NON-EMPLOYED LABOURINCOME

The category labour - non-employed comprises all taxes and compulsory social contributions raised on transfer income of non-employed persons, where these could be identified. This transfer income includes social transfers that are paid by the state (e.g. unemployment, invalidity and health care benefits) and benefits from old-age pension schemes (both state and occupational pension schemes). In this report, taxes on pension benefits are allocated to non-employed labour income and in certain cases to capital income. Part F gives more detail on how Member States use various estimation methods based on tax return data in order to split tax revenue across different sources of income.

Box C.2: Definition of taxes on labour

## Employed labour

From D. 51 Taxes on income:
D.51A+D.51C1 Taxes on individual or household income including holding gains (part raised on labour income)
From D. 29 Other current taxes:
D.29C Total wage bill and payroll taxes

From D. 611 Employers' actual social contributions:
D.611C Compulsory employers' actual social contributions

From D. 613 Households' actual social contributions:
D.613CE Compulsory employees' actual social contributions

Non-employed labour
From D. 51 Taxes on income:
D.51A+D.51C1 Taxes on individual or household income including holding gains (part raised on social transfers and pensions)
From D. 613 Households'actual social contributions:
D.613CS+D.613CN Compulsory actual social contributions by self- and non-employed persons (part paid by social transfer recipients)

## TAXES ON INCOME OF THE SELFEMPLOYED

The question arose whether part of the self-employed income should be treated as a remuneration of labour and whether the related taxes should be included in taxes on labour. The best compromise between economic rationale and data availability was to consider self-employment income as income from capital: selfemployed income is genuinely an entrepreneurial income and self-employed take the risk of incurring losses when exercising their activity. Personal income taxes as well as social contributions of self-employed are, therefore, allocated to the capital income subcategory for self-employed. This assumption includes the part of selfemployment income equivalent to the remuneration of self-employment own labour. For some Member States, this assumption does not reflect the situation of some self-employed, whose economic status or income does not significantly differ from those of wage earners. In Italy, for example, the National Statistical Office (ISTAT) provides official estimates of the percentages of 'mixed income' that can be attributed to labour and capital.

## Taxes on capital

Capital is defined broadly, including physical capital, intangibles and financial investment and savings (see Box C.3). Capital taxes include taxes on business income in a broad sense: not only taxes on profits but also taxes and levies that could be regarded as a prerequisite for entering into production/earning profit, such as the real estate tax, as long as owners rather than tenants are taxed, or the recurrent motor vehicle tax paid by enterprises. In their empirical study Desai and Hines (2001) confirmed that these indirect taxes also influence investment decisions of American multinational firms. They also include taxes on capital stocks of households or their transaction (e.g. on real estate). A distinction is drawn between taxes on capital and business income and taxes on capital stock.

## Box C.3: Definition of taxes on capital

## Capital and business income taxes:

From D.51- Taxes on income:
D.51A+D.51C1 Taxes on individual or household income including holding gains (part paid on capital and selfemployed income)
D.51B+D.51C2 Taxes on the income or profits of corporations including holding gains
D.51C3 Other taxes on holding gains
D.51D Taxes on winnings from lottery and gambling
D.51E Other taxes on income n.e.c.

From D.613- Households actual social contributions:
D.613CS Compulsory actual social contributions by self-employed

## Taxes on stocks (wealth):

From D.214- Taxes on products, except VAT and import taxes:
D.214B Stamp taxes
D.214C Taxes on financial and capital transactions
D. 214 K Export duties and monetary compensatory amounts on exports

From D.29- Other taxes on production:
D.29A Taxes on land, buildings or other structures
D.29B Taxes on the use of fixed assets
D. 29 E Business and professional licences
D. 29 H Other taxes on production n.e.c.

From D.59- Other current taxes:
D.59A Current taxes on capital
D.59F Other current taxes on capital n.e.c.
D. 91 Capital taxes
'Taxes on capital and business income' that economic agents earn or receive from domestic resources or from abroad includes taxes on income or profits of corporations (Box C.4), taxes on income and social contributions of the self-employed, plus personal income tax raised on the capital income of households (rents, dividends and other property income) (Box C.5). In practice this is mainly the personal income tax paid on dividend and interest income and entrepreneurial
activity (part of D.51A + D.51C1) and corporate income tax (D.51B + D.51C2) as well as other taxes on holding gains (D.51C3). This category is further subdivided into 'Taxes on the income of corporations' (using the 'Taxes on the income or profits of corporations including holding gains') and 'Taxes on the income of households', which comprises the remaining sub-headings of 'Capital and business income taxes'.

Box C.4: Definition of taxes on the income of corporations

Taxes on the income of corporations
From D.51-Taxes on income:
D.51B+D.51C2 Taxes on the income or profits of corporations including holding gains
'Taxes on capital stock' include the wealth tax (D.59A), capital taxes (D.91) including the inheritance tax (D.91A), the real estate $\operatorname{tax}$ (D.29Aa) or taxes on the use of fixed assets (D.29B). Professional and business licences (D.29E), and some taxes on products (from the category D.214)
and possible other taxes and levies that could be regarded as a prerequisite for entering into production if not allocated elsewhere would fit in this category even if the tax base is not the stock of wealth.

Box C.5: Definition of taxes on the capital and business income of households

Taxes on capital and business income of households:
Taxes on capital and business income of households:
From D. 51 Taxes on income:
D.51A+D.51C1 Taxes on individual or household income including holding gains (part paid on capital and self-
employed income)
D.51C3 Other taxes on holding gains
D.51D Taxes on winnings from lottery and gambling
D.51E Other taxes on income n.e.c.

From D. 613 Households' actual social contributions:
D.613CS Compulsory actual social contributions by self-employed persons

## Part D: Environmental Taxes

The definition of an environmental tax in "Environmental taxes - a statistical guideline" (European Commission 2013) refers to a tax 'whose tax base is a physical unit (or a proxy of a physical unit) of something that has a proven, specific negative impact on the environment, and which is identified in ESA as a tax' ${ }^{(5)}$. Details on the classification of environmental taxes can be found in 'Environmental taxes - a statistical guide'. While

[^84]the motivation for introducing the taxes - fiscal or environmental - is not decisive for the classification, its impact on costs and prices is. As the statistical guideline states: ' The definition puts emphasis on the effect of a given tax in terms of its impact on the cost of activities and the prices of products that have a negative effect on the environment. The environmental effect of a tax comes primarily through the impact it has on the relative prices of products and on the level of activities, in combination with the relevant price elasticities.'

Environmental taxes comprise taxes on energy, transport, pollution and resources, but value-added type taxes are excluded because they are levied on all products. Environmental taxes represent a sub-category of indirect taxes, in general consumption taxes, but may sometimes also represent taxes on the capital stock.

In line with the definition of the statistical guideline, in this publication environmental taxes are divided in three groups: energy taxes, transport taxes (excl. fuel) and a category combining pollution and resource taxes. For the purposes of this report, the following should be noted:

- Energy taxes include taxes on energy products used for both transport and stationary purposes (denoted 'E' in the National Tax List (NTL)). The most important energy products for transport purposes are petrol and diesel. Energy products for stationary use include fuel oils, natural gas, coal and electricity. Note that $\mathrm{CO}_{2}$ taxes are included under energy taxes (rather than under pollution taxes), as it is often not possible to identify them separately in tax statistics. A further disaggregation is provided for energy taxes, namely a category giving the tax revenues stemming from the transport use of fuels. Transport fuel taxes include only those taxes which are levied on the transport use of fuels/energy products (including $\mathrm{CO}_{2}$ taxes) and hence form a subgroup of energy taxes. The derivation of these data is explained under the heading "Transport fuel taxes" below.

Transport taxes (excl. fuel) mainly include taxes related to the ownership and use of motor vehicles (denoted ' $T$ ' in the NTL). Taxes on other transport equipment (e.g. planes), and related transport services (e.g. duties on charter or schedule flights or air passenger tax) are also included here, when they conform to the general definition of environmental taxes. The transport taxes may be'one-off'taxes related to imports or sales of the equipment or recurrent taxes such as an annual road tax. As indicated by the title, taxes on petrol, diesel and other transport fuels, are not included here but are included under energy taxes.

- The last group of pollution/resource taxes includes two groups of taxes (denoted 'P' and 'RS respectively in the NTL). Pollution taxes are taxes on measured or
estimated emissions to air and water, management of solid waste and noise - with the exception of $\mathrm{CO}_{2}$ taxes, which, as discussed above, are included under energy taxes. The second group - resource taxes includes any tax linked to extraction or use of a natural resource. This means that licences paid for hunting, fishing and the like are classified as resource taxes, because these activities deplete natural resources. Note that as of the 2013 edition of this publication, taxes on the extraction of oil or gas are not anymore booked as resource taxes, in line with the statistical guideline.

The taxes included as environmental taxes and their respective categories are listed in the NTL for each Member State on the webpage of the Taxation and Customs Union Directorate General and on the Eurostat website.

## Estimation of revenues from transport fuel taxes

Transport fuel taxes are defined as taxes on energy products used for transport purposes only. This category aims at representing the tax burden falling on transport energy products, i.e. transport fuels.

However, National Tax Lists alone are generally not detailed enough to enable this breakdown of tax revenues between transport and non-transport uses of fuel and energy taxes, and auxiliary sources detailing revenues by fuel type and energy uses by fuel types have to be used.

The first estimation strategy is to rely on national sources: all countries have been asked to provide data on tax revenues from mineral oils used in transport only (such as tax revenues from diesel or LPG used for transport purposes only - or just the aggregate of overall mineral oil taxes from transport use) and indicate whether the data are recorded on accrual or cash basis. When necessary, use is made of existing Eurostat and DG "Taxation and Customs Union" data bases to complement the information provided or substitute for the missing information (see box D1).

Box D.1: Auxiliary sources to attribute fuel taxes revenues to transport and stationary uses

## The following data sources are available:

- The National Tax Lists (NTL) which provide overall fuel tax revenues
- The European Commission Excise duty rates which collect information on (1) revenue and (2) rates from "taxes on consumption (excise duties and similar charges) other than VAT on energy products and electricity". This information is supplied by the EU member states, but not necessarily following ESA2010 methodology. Revenue data are classified according to eight different product categories and two summary categories. Excise rates are given following the same classification, further broken down according to sector and uses.
I) Leaded petrol/Lead substitute petrol
II) Unleaded petrol
III) Diesel
IV) LPG and Methane
V) Heavy fuel oil
VI) Sum of I)-IV): Total revenues from all mineral oils
VII) Natural gas
VIII) Coal and Coke
IX) Electricity
X) Overall sum: Total revenues from all energy products \& electricity
- Eurostat public database:The Eurostat public database provides data on environment and energy, and in particular the energy balances from supply through transformation to final energy consumption and uses of energy products, including various oil products (nrg_102a). Among the final energy uses, the final energy consumption for transport covers all transport sectors (rail, air and water) for all transport use (business, private).

Revenues from transport fuel taxes are estimated using the following principles and sources. Excise duty data (ED) collected by the European Commission are used as a source of data on tax revenues from mineral oil duties. EUROSTAT energy balances provide transport and nontransport uses in final energy consumption. Combining consumption uses with excise rates (also available from the ED database), revenues from transport and nontransport uses can be estimated. This proportion is then applied to the relevant taxes in NTLs.

Additional assumptions are needed for the calculations:
Data on final energy consumption uses tonnes (or toe or TJ ) as a measure of the volume of liquid components, whereas excise duties for Petrol and Diesel are defined as Euro/litre. For diesel/gas oil the 'typical' conversion factor suggested by Eurostat of $1185 / / 1000 \mathrm{~kg}$ is used.

- Moreover, usually more than one tax rate is in place for a product category used for transport purposes. Tax rates on transport diesel are often differentiated according to the diesel's sulphur or bio diesel content; LPG used for public transport is often taxed at reduced rates or tax exempt altogether. In case multiple tax rates do not permit the application of the general formula 'tax rate x amount of transport fuel in litres', a different approach is used. Transport tax revenues are derived as the difference between total tax revenues
according to the product category given by the ED data, namely III) Diesel or IV) LPG and Methane, and the non-transport tax revenues. Calculating non-transport tax revenues by applying the general formula proved feasible as non-transport tax rates are usually less differentiated.

As the ED data does not necessarily follow the ESA2010 methodology used in the NTL further adjustments have to be made to derive the amount of transport fuel taxes according to ESA2010 methodology. First, the shares of transport fuel taxes in mineral oil taxes and in overall energy taxes in ED data are calculated. This is achieved by the division of the estimated transport fuel taxes by VI) Total revenues from all mineral oils and by X) Total revenues from all energy products \& electricity, respectively. The resulting shares are then applied to the respective categories in the NTL. Preferably, the ED share of transport fuel taxes to mineral oil taxes is applied to the NTL category of mineral oil tax revenues, as usually the concepts for mineral oil taxes as given in the NTL and in the ED data are linked closely. The application of this share gives hence a proxy of 'tax revenues stemming from the transport use of fuels' according to the ESA2010 methodology, which is the one published in the report. In case of unavailability of the category mineral oil taxes in the NTL, the share of transport fuel taxes to energy taxes resulting from the ED data is applied to energy taxes in the NTL.

In some cases it was necessary to apply the split between transport fuel tax revenues and other tax revenues as provided by the Member States - mostly in cash data - to the respective category in the NTL, to give an approximation following the ESA2010 methodology.

While the estimation principles are comparable across countries, the extent to which the different sources have been used varies a lot across countries and time. The full estimation method described above has been used when the only information available is fuel tax revenues from the NTL. On the other hand, as the breakdown of transport and other fuel excises is already recorded in the National Tax List of Poland, no further calculations were necessary for that country. For other countries, total revenues attributed to transport fuel taxes were directly
provided by the Ministry of Finance. Others (Belgium, Italy) provided the directly usable share of the fuel tax revenues that are to be attributed to transport fuel taxes. When data are provided on a cash basis (Czech Republic, Denmark, Germany, Estonia, Spain, Croatia, Italy, Cyprus, Lithuania, Luxembourg, Netherlands, Austria, Portugal, Romania), the share of total fuel taxes on a cash base is calculated and applied to ESA2010 accrual data available in the NTLs ( ${ }^{6}$ ). In other cases as well a breakdown of excise revenues was provided by type of fuel. Each fuel was then attributed to transport or stationary uses (possibly broken down with the help of energy balances)

[^85]
## Part E: Property taxes

The classification of taxes on property applied in this report follows, with some adjustments, the approach employed in the OECD Classification of Taxes (2016), which distinguishes six categories of property taxes: 1) recurrent taxes on immovable property; 2) recurrent taxes on net wealth; 3) estate, inheritance and gift taxes; 4) taxes on financial and capital transactions; 5) other non-recurrent taxes on property and 6) other recurrent taxes on property.

The following comparative table (Box E.1) between System of National Accounts (2008 SNA) and European System of Accounts (ESA2010) was used, with the current report distinguishing only between "Recurrent taxes on immovable properties" - category 1 ) in the above OECD classification - and "Other property taxes" for all the other five categories of property taxes distinguished by the OECD.

Box E.1: Taxes on property - classification

In this publication the overall level of property taxes is thus obtained by aggregating the relevant revenue of the following ESA categories: D.214B, D.214C, D.29A, D.59A, D.91A, D.91B. The total is split between recurrent taxes (D.29A+D.59A (excl. wealth taxes)) on immovable property and other property taxes (D.214B, C + D.59A + D.91A, B). D.59A appears in the two groups of property taxes; wealth related taxes are excluded from recurrent property taxes and included only in the second group "Other property Taxes". Given the broad definition of the statistical categories some additional adjustments were made by National Statistical Offices: exclusion of recurrent taxes on motor vehicles, roads, boats, farm contributions,
stamp taxes on alcohol, tobacco (from D.214B, C) and other exclusions from D.29A and D.59A in a number of countries (Belgium, Czech Republic, France, Croatia, Italy, Cyprus, Latvia, Netherlands, Austria, Portugal, Romania, Slovenia, Slovakia and United Kingdom). The detailed list of taxes included in the computation of property taxes for every country is available in the National Tax List published online.

Possible discrepancies between results published by OECD and those presented in this report could stem from different allocation of tax payments in the two classifications - OECD and National Tax List (ESA2010) as well as from different time-points of data reporting.

# Part F: Implicit tax rates, split of personal income tax revenues and average effective tax rate 

In this last section of the methodological annex, information is given on the methodology followed for calculating implicit tax rates, for splitting personal income tax revenues and for estimating average effective tax rates.

The implicit tax rates are defined for each tax base category defined in part C. They are computed as the ratio of total tax revenues of the category (consumption, labour, and capital) to a proxy of the potential tax base defined using the production and income accounts of the national accounts.

## Data sources

National accounts data used in the construction of the denominator are extracted from the Eurostat public database with further national accounts data acquired for calculating the bases of the implicit tax rates on capital and capital income. The numerators are taken from the ratios calculated in Part C. In some cases, limitations in data availability may affect or prevent the calculation of the ITR. The ITR on capital is the most complex of the ITRs and suffers from problems related to patchy data availability. As a result, comprehensive figures for the ITR on capital have not been published in this edition, but the indicator is now under review and will appear again once it has been re-designed. Nevertheless, some indicative figures for the overall ITR on capital using the old methodology applied to ESA 2010 data are given in Part 1 along with some short notes regarding the limitations of the indicator. For completeness, a description of the methodology for the capital ITR that was applied in previous editions of the report is reproduced later in this section.

## Methodology

The tax revenue relative to GDP statistics presented in this survey can be described as macro backward-looking tax burden indicators. In Annex A tables 39 to 62 the taxes raised on different types of tax base are shown as percentages of total GDP and of total taxation. However, the consideration of tax revenue as a proportion of GDP provides limited information as no insight is given as to whether, for example, a high share of capital taxes in GDP is a result of high tax rates or a large capital tax base. These issues are tackled through the presentation of ITRs which do not suffer from this shortcoming.

ITRs measure the actual or effective average tax burden directly or indirectly levied on different types of tax base or activities that could potentially be taxed by Member States. Note, however, that the final economic incidence of the burden of taxation can often be shifted from one taxpayer to another through the interplay of demand and supply: a typical example is when firms increase sales prices in response to a hike in corporate income taxation; to a certain extent the firms' customers end up bearing part of the increased tax burden. The ITRs cannot take these effects into account, as this can only be done within a general equilibrium framework. Despite this limitation, ITRs allow the monitoring of tax burden levels over time (enabling the identification of shifts between the taxation of different types of tax base e.g. from capital to labour) and across countries. Alternative measures of effective tax rates exist, which, using tax legislation, simulate the tax burden generated by a given tax, and can be linked to individual behaviour. However, these 'forward-looking' effective tax rates do not allow the comparison of the tax burden implied by different taxes; nor do they facilitate
the identification of shifts in the taxation of different economic income and activities.

The comparability of these indicators has been enhanced by the improved consistency and harmonised computation of ESA national accounts data. However, this improvement can only be fully exploited by using the same denominator for all countries and not accounting for country-specific peculiarities in national tax legislation. For capital, an average tax rate is estimated by dividing all taxes on capital by a broad approximation of the total capital and business income both for households and corporations. For labour, an average tax rate is estimated by dividing direct and indirect taxes on labour paid by employers and employees by the total compensation of employees. The attractiveness of the approach lies in the fact that all elements of taxation are implicitly taken into account, such as the combined effects of statutory rates,
tax deductions and tax credits. They also include the effects due to the composition of income, or companies' profit distribution policies. Further, the effects of tax planning, as well as the tax relief available (e.g. tax bases which are exempted below a certain threshold, nondeductible interest expenses), are also taken implicitly into account. The advantage of the ITRs in capturing a wide set of influences on taxation is accompanied by difficulties in interpreting the trends when a complete and precise separation of the different forces of influence is not possible ${ }^{7}$ ). In addition, any timing differences that arise because of lags in tax payments and business-cycle effects may give rise to significant volatility in these measures. In short, they represent a reduced model of all variables influencing taxation, tax rates and bases.
(7) $\operatorname{OECD}(2000,2002)$.

Box F.1: Definition of the implicit tax rate on consumption

## Implicit tax rate on consumption (ESA2010)

Taxes on consumption / (P.31_S.14dom)
Numerator: see Box C. 1 - taxes on consumption
Denominator: P.31_S.14dom: Final consumption expenditure of households on the economic territory (domestic concept)

## Implicit tax rate on consumption

The ITR on consumption is defined as all consumption taxes divided by the final consumption expenditure of private households on the economic territory (domestic concept) (see Box F.1)

In the analytical section of the report (Part1), the ITR on consumption is split into four categories (only the numerator is broken down; the denominator remains the same for each sub-category). The identification of the revenue is done on the basis of the National Tax List. The four categories are as follows:

- VAT: the share of the ITR on consumption relating to VAT (D.211-type taxes).
- Energy: this sub-category includes all consumption taxes on energy listed in the National Tax List; these cover mainly excise duties on mineral oils, duties on electricity or similar taxes; the definition may differ slightly from the one used for Tables 65 and 66 in Annex A, as the latter may also include energy taxes levied on capital or labour.
- Tobacco and alcohol: these include all excise duties on alcohol and tobacco products listed in the National Tax List. For Italy the revenues from stamp duties are included.
- Residual: all remaining consumption taxes are booked in this sub-category; they are obtained as a difference from the total.

## Implicit tax rate on labour

The ITR on employed labour is defined as the sum of all direct and indirect taxes and employees' and employers' social contributions levied on employed labour income divided by the total compensation of employees working in the economic territory (see Box F.2). The ITR on labour is calculated for employed labour only (so excluding the tax burden falling on social transfers, including pensions). Direct taxes are defined as the revenue from personal income tax that can be allocated to labour income. Indirect taxes on labour income, currently applied in some Member States, are taxes such as payroll taxes paid by the employer. The compensation of employees is defined as total remuneration, in cash or in kind, payable by an employer to an employee in return for work done. It consists of gross wages (in cash or in kind) and thus also the amount paid as social insurance contributions and wage withholding tax. In addition, employers' social contributions (including imputed social contributions) as well as to private pensions and related schemes are included. Personal income taxes and social contributions paid by EU civil servants to the EU Institutions are not included. Compensation of employees is thus a broad measure of the gross economic income from employment before any charges are withheld.

Box F.2: Definition of the implicit tax rate on labour

| Implicit tax rate on employed labour (ESA2010) | Direct taxes, indirect taxes and compulsory actual social <br> contributions paid by employers and employees, on <br> employed labour income/ (D.1 + D.29C) |
| :--- | :--- |

Numerator: see Box C. 2 - Taxes on Labour: Employed labour
Denominator: D. 1 Compensation of employees, D.29C Wage bill and payroll taxes

The fundamental methodological problem in calculating the ITR on labour and capital is that the personal income tax is typically broad-based and relates to multiple sources of income (i.e. employed labour, self-employed labour, income from capital and income in the form of social benefits and pensions received). The note on the PIT split explains the calculations for estimating the part of the revenue from personal income tax that can be attributed to labour income and other income sources.

The resulting ITR on labour should be seen as a summary measure that approximates an average effective tax burden on labour income in the economy. It must be recognised that the tax ratio may hide important variation in effective tax rates across different household types or at different wage levels ( ${ }^{8}$ ). For example, cuts in taxes or social contribution rates that are targeted on low-wage, low-skill workers or families with children may have a small impact on the overall ITR and yet be effective in raising take-home pay for the beneficiaries. The decomposition of total tax wedges, for example, may be quite different at relatively low or relatively high wage levels. Also, in some Member States the recent fiscal reforms may have had more pronounced effects on low-wage, low-qualified workers or on families with children.

When interpreting the time-series comparisons, it should be borne in mind that the evolution refers to an expost trend, which does not disentangle cyclical, structural and policy elements. This implies that the observed changes may only partially reflect discretionary tax policy measures. In some Member States, for example, strong economic growth may have decreased the importance of allowances and tax credits and, therefore increased the average tax rate or have moved taxpayers into higher personal income tax brackets resulting in higher real tax payments (bracket creep). Moreover, taxpayers at the top of the pay scale may have witnessed relatively high increases in incomes, and such changes may have induced a cyclical swing in the ITR on labour that may to some extent offset the (ex ante) expected fall driven by tax reforms aimed, for example, at reducing the tax burden at the bottom to the middle end of the distribution. Even in the absence of strong economic growth but in the case of inflation, 'bracket creep' can operate if tax brackets are not adjusted to take account of inflation.

[^86]In the chapter analysing the trends in the ITR on labour, the ITR on labour is presented, along with the tax wedge for a single worker at two thirds of average earnings. In the 2004 edition of this publication a comparison between the ITR on labour and the tax wedge for a single worker without children at average earnings was computed for the EU-15. The ITR on labour was lower than the tax wedge at average earnings in all but three Member States. The difference amounted to a maximum of well above 10 percentage points and to eight percentage points on the weighted EU-15 average. Somewhat surprisingly then the ITR on labour was closer to the tax wedge at two thirds of the average earnings than the one at average earnings. This can be due to the fact that employees at the lower end of the pay scale are generally subject to relatively lower taxation or even no taxation at all and have a substantial weight in the calculation of the ITR on labour. Another explanation for the lower level of the ITR on labour with respect to the tax wedge for a single worker without children at average earnings is the fact that the former takes account of non-standard tax reliefs (e.g. medical expenses) which are not considered by the latter. See European Commission (2004b, pp. 101-104).

## Implicit tax rates on capital

The implicit tax rate on capital and its sub-components are the most complex of the ITRs both to construct and to interpret. The ITR on capital has not been published comprehensively in this edition, but is now under review and will appear again once it has been re-designed. Nevertheless, for completeness, a full description of the methodology for the capital ITR that was applied in previous editions of the report (based on ESA95) is reproduced in this section. Some indicative figures for the overall ITR on capital using the old methodology applied to ESA 2010 data are given in Part 1 along with some short notes regarding the limitations of the indicator.

## Properties of the implicit tax rate on capital

The overall implicit tax rate on capital is computed as the ratio between revenue from all capital taxes, and all (in principle) potentially taxable capital and business income in the economy. It aims at representing the average tax burden falling on capital income.

Our definition of taxes on capital does not stop at taxes levied on capital income streams, such as the corporate income tax, but includes taxes on stocks of wealth or capital assets, stemming from savings and private sector investments in previous periods; as well as taxes on asset transactions. In other words not only taxes on profits are included but also, for instance, taxes and levies that could be regarded as a prerequisite to earn them, like the real estate tax or the motor vehicle tax paid by enterprises; this kind of taxes have to be paid also by non-profitable entities, and, therefore, cannot properly be treated as taxes on income streams. Given that national accounts do not provide any indicator for the tax base of taxes levied on capital stocks or their transactions (e.g. a harmonised measure of the stock of capital or of asset transactions), the overall ITR on capital simply uses as a denominator potential capital and business income; however, this publication also includes a more narrowly defined ITR on capital and business income which excludes taxes on wealth or the capital stock but simply measures the average effective tax burden on private sector investment and saving, as a ratio between taxes paid on capital income streams and the aggregate of capital and business income.

Of the various implicit tax rates, the ITR on capital is the most complex ( ${ }^{(9)}$. Its trend can reflect a very wide range of factors, which can also vary for different Member States. In particular, three main factors may distort the ITR on capital and business income in the short and medium run.

- Time lags: theoretical considerations as well as empirical evidence suggest that the ITR on capital income is sensitive to the business cycle. Unlike other taxes the corporate income tax is characterised by long and variable lags between the emergence of income and its taxation, due notably to the possibilities to defer taxation because of previously incurred losses or group taxation.
- Capital gains: expansionary phases, for example in the late 1990s, are accompanied by booming stock markets all over the EU. As a result, capital gains and the corresponding tax revenues may rise substantially. However, given that capital gains are not included in the denominator of any ITR on capital, this
development clearly leads to an overestimation of the average effective tax burden on capital and business income, and partly explains the rise in the ITR for some Member States.
- Structural changes in the financing of companies: for example, national accounts data show that from 1995 to 2002, in most Member States a relative shift in financing from debt to equity occurred such that capital income consists less of interest and more of dividend payments. This happened against the background of falling interest rates. Most tax systems in the EU are not neutral concerning financing and allow interest payments to be deducted from the tax base. The shift towards higher dividend distributions results in an increase in the measured average tax burden $\left({ }^{10}\right)$ at unchanged legislation.

Furthermore it is important to note that a cut in the statutory rate that is offset by an equivalent widening of the tax base will leave the ITR on capital unchanged. This is not a limitation of the indicator, but rather an advantage given that the ITR aims at measuring the effective tax burden. This property of the indicator may contribute to explain the relatively limited fall in the ITR on capital in the last years despite significant EU wide reductions in statutory corporate tax rates.

Interpreting the ITRs on capital one should bear in mind that the bases used for the computation are, particularly in the new Member States, not only narrower but also more volatile than GDP as a whole, and thus subject to wide swings. Hence, the overall volatility of this ratio is significantly higher than that of the other ITRs. A degree of caution is, therefore, advisable when making crosscountry comparisons or comparisons of one Member State with the EU averages.

Large changes in backward-looking measures of the tax rate on capital are not unusual and not limited to macro indicators. Tests on Belgium and Sweden (1) report annual changes of several percentage points for effective tax rates derived both from national accounts data or tax statistics using micro data for companies. The calculations presented here have similar features.

[^87]${ }^{(11)}$ Valenduc (2001), Clark (2002).

Box F.3: Definition of the implicit tax rate on capital (income)

|  | Implicit tax rate <br> on capital (income) | Capital (income) taxes / <br> $(1)+(2)+(3)+(4)-(5)+(6)-(7)+(8)-(9)+(10)-(11)+$ <br> $(12)+(13)+(14)-(15)+(16)-(17)+(18)+(19)$ |
| :--- | :--- | :--- |
|  | Numerator: | see Box C.3-taxes on capital |
|  | Denominator: |  |
| (1) | B.2n_S.11-12 | Net operating surplus of non-financial and financial corporations (incl. quasi-corporations) |
| (2) | B.2n_S.14-15 | Imputed rents of private households and net operating surplus of non-profit institutions |
| (3) | B.3n_S.14 | Net mixed income of self-employed |
| (4) | D.41_S.11-12rec | Interest received by non-financial and financial corporations |

| (6) | D.44_S.11-12rec | Insurance property income attributed to policy holders received by non-financial and |
| financial corporations |  |  |

Moreover, statistical issues related to the sector data used to compute the denominator of the ITRs might also influence the results. National accounting data are in fact regularly revised. In 2006, complying with the EU legislation ( ${ }^{(2)}$, the Member States were required to introduce a number of important methodological revisions in their national accounts in order to improve the measurement of GDP. In particular, the main change, as for the sector accounts, was the allocation of the Financial Intermediation Services Indirectly

Measured (FISIM ( $\left.{ }^{(3)}\right)$ to user sectors/industries, instead of intermediate consumption. Imports of FISIM have also been recorded. At certain moments several Member States did not entirely conformed to the methodological regulations. It is, therefore, possible that statistical artefacts influence the time series, particularly in those points where data compiled according to a new methodology are joined with old-series data.

[^88][^89]
## The implicit tax rate on capital and the implicit tax rate on capital and business income

The implicit tax rate is calculated for total capital taxes and for the subcategory of taxes on capital income (which differs from capital taxes overall because it excludes taxes on the stock of capital) ( ${ }^{(4)}$. Both indicators have the same denominator, i.e. total profit and property income from both corporations and households. In the case of taxes on capital income, the denominator does not correspond to the actual tax base; it is in some ways narrower (omitting capital gains) and in other ways broader (excluding some deductions from the tax base). As for 'capital taxes on stocks and wealth', the denominator does not take into account any asset or wealth on which the tax is levied. In addition, two additional disaggregated ITRs, on corporate income and on capital and business income of households are computed. These do not add up to the ITR on capital and business income.

The computation of the ITRs for the whole 1995-2011 period was not possible for four (Bulgaria, Luxembourg, Malta and Romania) out of the 27 Member States and only partly possible for another four Member States (Denmark, Estonia, Ireland, Greece and Spain), mainly because of lack of data availability in the sector accounts. In order to obtain EU averages as accurate as possible, the missing values for the latter group of countries were replaced with the latest available figures and the average was labelled 'adjusted'. Likewise, if the data for the beginning of the series are missing, for the purpose of calculating EU averages only the value for the country is proxied by the first available data point. In the case of Luxembourg, following the methodological changes in national accounts regarding the FISIM and given the sizeable weight of the financial sector in this country, it no longer seems appropriate to employ a simplified methodology to compute the ITRs on capital as done until the 2007 publication of the report. The ITRs will be published when a complete set of sector accounts is available. Until the 2008 edition of the report, the ITR was computed with reference to a simplified set of data for Ireland. As of the 2009 edition, a full sector accounts dataset is available and the use of it resulted in a downward revision of the ITR.

Of the various implicit tax rates, the ITRs on capital are by far the most complex and given their limitations should be interpreted very carefully. A first problem is that as indicated below, the ITR on capital is broadly based and, therefore, reflects a wide range of factors. In particular, the definitions of the ITR denominators can only roughly approximate the worldwide capital income of a country's residents for domestic tax purposes. This does not mean that on the side of companies profits of foreign affiliates are consolidated within the (domestic) parent company.

[^90]National accounts disregard the foreign ownership of subsidiaries located on the economic territory when the generation of profits is recorded. They are simply treated as domestic companies $\left(^{(5)}\right.$. However, the base of the ITR does not measure the actual base of tax legislation, which drives tax revenues. So in practice it is not easy to link developments in the overall ITR on capital and business income to the various statutory tax rates and other policy changes.

Capital and business income according to national accounts is defined as profits and property income. Profits are defined as net operating surplus ( B .2 n ) of the private sector including corporations (and quasi-corporations), private households, and non-profit institutions and mixed income (B.3n) of the self-employed. The net operating surplus of the government sector is excluded, because losses or profits of the government are not subject to taxation.

There is no simple way of approximating the tax base for property income (mainly interest and dividends) for the whole private sector. A specifically defined balance of property income of the private sector (received minus paid) is used. The objective for the definition of this balance was to approximate the potentially taxable profit of a company and the taxable capital income of private households.

Taxable profits of companies consist of net operating profit and property income received (financial income) less certain deductible elements of property income paid. The property income deductible from the tax base includes interest (D.41), property income attributed to insurance policyholders (D.44) and rents on land (D.45). Dividends (part of distributed income of corporations D.42) are part of the financial income but they cannot be deducted to calculate the taxable base in national tax legislation ${ }^{(6)}$. For private households, the taxable capital income consists almost completely of interest and dividend payments received and of property income attributed to policyholders received from insurance companies and pension funds.

[^91]The balance of D. 44 received minus paid usually nets off for the whole private sector. The definition takes into account the received property income from abroad and improves the measurement of profits from banks and insurance companies. However, for the ITR on capital several sources of bias compared to taxable profits remain.

- Since the calculation of depreciation of fixed capital in national accounts uses prices of the current period, it differs a lot from methods used in profit and loss accounts. Additionally, the calculation of consumption of fixed capital is not comparable across countries. This could lead to additional biases in measuring the effective tax burden on capital.
- Capital gains are not part of profits in national accounts because they are not related to the production process. This important part of taxable profits of (financial) companies is disregarded in calculating the denominator and leads to an overestimation of the ITR on capital and business income as far as capital gains are taxed. The same is true as regards the capital gains of private households, which are often taxed under the personal income tax. All this is likely to affect international comparability, as some countries have a greater share of financial company profits including gains.
- Central banks are part of the financial corporations sector in national accounts. The inclusion of their (non-taxable) profits in the denominator leads to an underestimation of the ITR on capital and business income.
- For taxable third-pillar private pension benefits, treated as income from capital in the split of the personal income tax (PIT), no corresponding income flow is recorded in national accounts. Ignoring these benefits in the potentially taxable capital and business income in the denominator leads to an overestimation of the ITR.
- In the Eurostat data on national accounts for the EU Member States, interest payments by households and self-employed are not available separately. Taking the total net interest as part of the denominator accounts for tax deductible interest payments of self-employed but leads to an overestimation of the ITR on capital because interest payments for mortgage and consumer loans are not tax deductible in most Member States.
- Unlike net operating surplus, taxable profits and tax revenues are reduced by losses carried forward, causing a cyclical mismatch with the base and cyclical fluctuation in the ITR, which sometimes makes the trend difficult to interpret. This may also distort international comparisons. In addition, the difference in the measurement of imputed rents on owneroccupied dwellings between national accounts and tax legislation is another source of bias.
- The overall ITR on capital and business income for corporations and households is influenced through various channels. Therefore, developments of this indicator are sometimes difficult to explain.

## The ITR on capital income of corporations and the ITR on capital income of households and self-employed

The interpretation of the overall ITR on capital and business income of corporations and households is complicated by the overlapping effects of the various channels previously described. Although difficulties of interpretation stemming from the backward-looking character of the indicator remain, the reading of the ratios is in fact simplified when splitting the ITR between an ITR for the corporate sector and another ITR for the households sector. However the breakdown is not perfect as the denominators of the two indicators are partly overlapping.

The numerator of the overall ITR can be split using the allocation of taxes to the category 'income corporations', '(capital) income households' and 'income selfemployed' ( ${ }^{(7)}$. In most countries, tax revenues raised on corporate income equal the aggregate D.51b +D .51 c 2 'Taxes on the income or profits of corporations including holding gains' (Box F.4). For Germany, Italy and Austria revenues from local or regional business taxes are added. In general, the other tax categories of the overall ITR numerator are allocated to the households sector (Box F.5). The other two categories ('(capital) income households' and 'income self-employed') are taken as numerator of the ITR on capital and business income for households. This includes mainly taxes on holding gains of households, the share of personal income tax on capital and on the self-employed and the social contributions paid by the latter.

The denominator includes the mixed income of the self-employed, the net operating surplus of households, dividends and attributed insurance property income received and the difference between received and paid interest and rents ${ }^{(8)}$. The denominator for corporations consists of their net operating surplus, the difference between received and paid interest and rents and a specific definition of dividends minus property income from insurance companies and pension funds attributed to policyholders ( ${ }^{(9)}$.

In calculating the potential taxable base of the corporate sector, interest income received by collective investment funds is included, even though such income is generally exempt from taxation in most EU countries (taxation

[^92]occurs at the level of the individual investor rather than at the level of the fund). The impact of this on the calculation of implicit rates differs according to the relative size of the funds industry as compared to the overall economy in each Member State. In Ireland, which has a large international investment funds industry, the inclusion of this tax-exempt income has a disproportionate impact on the calculation of implicit rates of corporate income for Ireland, as compared to other Member States, with the resulting estimates being significantly reduced.

When splitting the ITR on capital income for (nonfinancial and financial) corporations and households, the flows of property income between these two sectors are of particular importance. A clear split can be made for the national accounts categories interest payments (D.41) and rents (D.45).

In principle, dividends are part of the taxable financial income of a company. They are subject to double taxation because corporate taxes have been levied on the profit at the level of the distributing company. In order to limit or offset the double taxation at the level of the shareholder (corporation or individual) Member States apply different taxation schemes. However, most countries do not offset fully the double taxation. If the dividends received are part of the potentially taxable base, the ITR on corporate income will be lower in those countries which give greater relief for the double taxation of dividends compared to a country that fully applies the classical system.

However, it would be deceptive to count only the dividends received by financial and non-financial
corporations. Because the net operating surplus out of which dividends are distributed is already part of the denominator the dividends would be partly counted twice. Dividends distributed by a company belonging to the sector for financial or non-financial corporations should not be counted. Only dividends received from abroad should be taken into account when constructing the ITR for all corporations.

Unfortunately, information on dividends distributed from the rest of the world to domestic corporations is not available in the Eurostat database of national accounts. For dividends (and nearly all other flows in national accounts) we only know what a specific sector receives from all other sectors and what it pays to all other sectors. However, this information can be used to approximate the dividends received by corporations from abroad. From the total sum of dividends received by corporations (D.42rec_S11-12) we deduct the dividends distributed by domestic corporations (D.42pay_S11-S12) in order to avoid double counting. However, this deduction is too large, as only the dividends distributed to domestic corporations should be subtracted. Therefore, dividends received by the government (D.42rec_S13), the rest of the world (D.42rec_S2) and households (D.42rec_S14-15) are added to the denominator. This approximation is only fully correct under the assumption that government and households do not receive dividends directly from abroad but through domestic banks and insurance companies. For households it can be expected that they receive a certain part of dividends from abroad, meaning that the dividends included in the denominator are overestimated.

see Box C. 5 - taxes on the capital and business income of households

Imputed rents of private households and net operating surplus of non-profit institutions
Net mixed income of self-employed
Interest received by households, self employed and non-profit organisations Interest paid by households, self employed and non-profit organisations Rents on land received by households, self employed and non-profit organisations
Rents on land paid by households, self employed and non-profit organisations Dividends received by private households, self-employed and non-profit organisations
Insurance property income attributed to policyholders received by private households, self-employed and non-profit organisations

Due to the double taxation of dividends at the company level and at the shareholder level these payments (or the underlying profits) need to be included in both indicators, for corporations and for households. With these definitions the ITRs on capital and business income for households and on corporate income do not sum up to the overall ITR. For the overall implicit tax rate on business and capital income the dividend payments between the corporations and the households' sector need to be consolidated.

However, with the 'property income attributed to insurance policyholders (D.44)' there exists another income flow for distributing profits from financial corporations to private households ${ }^{(20)}$. Insurance companies and pension funds collect contributions from their insurance policies or schemes, and after deducting their operating costs they invest them in the capital market or in other assets. From this (financial) investment they receive property income in the form of interest, dividends or rents as well as capital gains through trading stocks, bonds etc. This return on investment constitutes partly the profit of the insurance companies and partly belongs to the insurance policyholder as laid down in the insurance contract. It is that part attributed to the policyholders (excluding capital gains) ( ${ }^{21}$ ), which,

[^93]in national accounts, is transferred via the D. 44 mainly to private households in the period when this property income accrued.

In principle, most EU Member States provide a tax exemption of this income in the hands of the financial institution. Several methods are used. In some cases, the institution is tax exempt (certain pension funds); in other cases income is exempt or neutralised in the profit calculation by deducting an insurance technical reserve. However, some Member States levy a withholding/ capital yield tax on this income which is not always neutralised on the level of the company.

The preliminary split of the ITR on capital income for corporations and households presented in the 2003 edition did not take the flow D. 44 into account. This means that the return on investment was fully allocated to financial corporations. It was based on the fact that there is no actual flow of income in the period in which insurance companies earn income on behalf of policyholders. In national accounts, income received by insurance companies or pension funds by investing their technical reserves in financial assets or buildings is only 'attributed' to insurance policyholders. It is 'recollected' afterwards through imputed higher insurance contributions. Because these flows are purely imputed within national accounts, no taxes - at this stage - are raised on the level of the insurance policyholder.

However, it seems that the tax exemption of such earnings is the dominant regime for the taxation of pension funds and insurance companies in Europe. It means that D. 44 paid by financial corporations has to be deducted from the ITR tax base for corporate income. In the countries
where capital yield taxes are levied on these earnings and the tax revenues are allocated to corporations, the ITR on corporations would be overestimated.

In turn, D. 44 is added to the ITR tax base for the capital income of the households sector. In most countries, private households are taxed on the benefits or distributions by pension funds or insurance companies when the payoff period starts. This can be an amount of capital or an annuity. For the definition of an ITR on capital income for households this means that we encounter a problem of periodicity. With the property income earned on behalf of the policyholder period by period, insurance companies build up reserves (liabilities) in order to pay the benefits in later periods. However, D. 44 could be regarded as proxy for the taxable part of pension benefits and insurance payoffs, which would not include the initial contributions or premiums.

The corporations sector in national accounts also comprises partly unincorporated enterprises, the socalled quasi-corporations. In many countries, these quasi-corporations also have to pay corporate income tax. However, there are some important exceptions. In Germany, partnerships (Personengesellschaften) constitute a large number of the country's companies and these are treated as quasi-corporations. Their production and profits etc. are recorded in the corporations sector in national accounts. Because they do not have an independent legal status, their owners are taxed under the PIT scheme. The related tax payments are recorded within the households sector in national accounts (22). In the classification adopted in this publication, they are reported within 'taxes on self-employed'. This means that tax revenues are booked in a different sector than the underlying business income. Ignoring this booking principle by calculating ITRs on capital income for corporations or households (including self-employed), using the sector information of national accounts without corrections would lead to biased ITRs. Similar problems exist for Luxembourg, Austria, Finland and Portugal. According to information from Statistics Finland, the bias in Finland's ITRs is of minor importance. For Austria and Portugal a correction of the ITR on corporations has been introduced. A fraction of PIT for owners of these quasi-corporations is not available. Therefore, the part of PIT from self-employed that includes the taxation of profits from partnerships is extracted from the ITR on households and allocated to the corporations sector. At the same time, the approximation of the tax base for self-employed is also assigned to the corporations sector, consisting of mixed income. For Austria and Portugal the adjusted ITR represents the tax burden on all companies including the self-employed. For Germany, where partnerships are an important part of companies, it would be possible to employ a similar adjustment.

[^94]However, the German authorities expressed doubts on whether this adjustment would lead to results that are fully comparable with other countries.

The ITR on corporate income is generally lower than the statutory corporate tax rate. This can be explained by the fact that the ITR incorporates the effect of reduced rates (e.g. for certain assets, sectors or small profits), tax deductions affecting the base and the effects of tax planning by corporations in order to minimise their tax payments. It should furthermore be noted that the financial corporations described in national accounts include central banks and pension funds, while their profits, which are included in the denominator of the ITR, are not always subject to taxation. This is another element that explains the relatively low level of the ITRs. Making a comparison with an ITR using micro data from tax statistics, Valenduc (2001) finds that the ITR based on macro data tends to underestimate the effective taxation on company profits.

It is, however, possible that the ITR on corporate income exceeds the statutory corporate tax rate. This may depend, for instance, on the payment by corporation of taxes referring to profits earned earlier, or on taxes paid on capital gains (which are not included in our ITR denominator owing to a lack of statistics). A less straightforward but probably important effect is due to the impact of loss-making companies which not only individually display a zero ITR but curiously drive up the ITR for all profit-making companies; their own negative net operating surplus in fact offsets an equivalent but positive net operating surplus realised by other businesses which turn a profit and pay taxes on it.

The sensitivity to the business cycle is a general feature of backward-looking indicators that measure the average effective tax burden on economic activities. In principle, ceteris paribus, three different factors affect the ITR on capital income in an economic recovery.

- In countries with a progressive personal income tax, the ITR should rise in an upswing. If taxable income from capital and self-employment increases, the taxes raised on this income increase faster.
- Corporate tax schedules are generally not progressive and, therefore, the economic cycle should not affect the ITR via that channel of influence. However, some Member States do apply lower rates for small and medium-sized enterprises. In an on-going upswing some of these companies will exceed the tax legislative thresholds resulting in a higher tax burden.
- Rules on carry forward of company losses will generally result in asymmetric effects on the ITR. First, there is an asymmetry with regards to the timing of tax payments: when relying on aggregate data from national accounts, corporate income tax revenues appearing in the numerator of the ITR are reduced by
losses incurred in prior years, while the denominator is reduced by losses in current years. The numerator effect is caused by so-called loss 'carry forward' provisions in the tax legislation. The denominator effect results from the inclusion of loss-making firms, with current losses from loss-making firms offsetting profits of profitable firms in the aggregation. Losses are therefore incorporated in both the numerator and the denominator, but the losses are transmitted in the ITR asymmetrically in the sense that they refer to different periods. At the beginning of an economic upswing, more firms will make profits. Initially that the ITR on capital is reduced, because the resulting increase in profits is immediately reflected (in the denominator) but not fully in the tax payments (in the numerator) as losses from previous years are carried forward. However, one could expect that the latter effect diminishes over time, as loss-carry forward provisions are often restricted in time and more and more companies make profits as the upswing persists. This diminishing effect of loss carry-over provisions should therefore lead to a gradual increase in the ITR on capital due to progressive increases in tax payments. Second, a recessionary phase will generally exert an asymmetric impact on the numerator and the denominator of the ITR: the denominator will show the full amount of the decrease in aggregate corporate profits whereas the numerator will not reflect the full extent of the deterioration as a portion of taxpaying companies would have shown zero profits already in the preceding year and further deterioration is not taken into account (hence a greater effect on the denominator than on the numerator resulting in a slight anti-cyclical bias).

All in all, these effects are likely to offset each other to a certain extent in the initial phases of the cycle. However, in a long-lasting economic upturn these channels of influence will point most likely to an increase in the implicit tax rate on capital with a certain time lag.

## Structural factors affecting the development of the capital implicit tax rate

Beyond the effects of the business cycle, the changes in the ITRs might also reflect more structural changes, in particular in the composition of income. For example, given the increase in stock market capitalisation in the years 1995-2000, it is likely that significant capital gains were achieved by both companies and households, resulting in an increase in financial income. This change in the composition of income is not clearly discernible from national accounts income data, nor is it included in the tax base of the ITR. The additional tax revenues related to this kind of income could therefore have induced a rise in the ITRs on capital income, leading to an overestimation of the effective tax burden on capital income of the private sector. Following the same line of reasoning, the subsequent downturn in stock markets
could be an important element in explaining the reduction in the ITR on capital income in 2001.

Moreover, different tax provisions for different sources of income offer an additional explanation for the increase in the ITR on corporate income. Specific tax rates or special types of tax relief apply to different sources of income or expenditure. A common feature of corporate tax systems, for instance, is to favour debt finance relative to the financing of new investments by issuing new equity. For the ITR, dividend and interest payments are aggregated within the tax base. If financial markets induced a shift from interest to dividend payments, the taxable base would increase. In this case, companies will pay more taxes on capital since the deduction of interest expenditure for determining taxable profits is phased out. At the same time, however, the aggregate and consolidated tax base of the ITR will net off all flows of dividend distributions or interest payments between different companies (for instance between nonfinancial companies as borrower and banks or insurance companies as creditor) and private households. If a shift occurs from interest to dividend payments, it will not show up in the denominators, and hence the capital ITR will remain constant. The overall result of the higher tax revenues would be an increase in the ITR reflecting a higher effective tax burden that is caused by the effects of the tax legislation ${ }^{(23)}$.

## Implicit tax rate on energy

The nominal ITR on energy is calculated as the ratio between total energy tax revenues and final energy consumption, as calculated by Eurostat aggregating different energy sources on the basic of each source's net calorific value. Although out of analogy with the ITRs on labour, consumption, and capital the name ITR is employed, it should be noted that the former three are pure ratios expressed in percentage terms (or 'dimensionless numbers') while the ITR on energy is expressed in euro per tonne of oil equivalent.

The real ITR on energy differs from the nominal ITR in the sense that the nominal euro amount in the numerator of the ratio is deflated using the final demand deflator (base year 2010). Unfortunately no specific deflator for energy prices is available.

[^95]
## Methods used to split the revenue from personal income tax

## The sources of personal income tax

Apart from the aggregate data in national accounts, additional data made available by Member States have been used to split recorded tax revenues into more detailed categories. This is of particular importance for
the recorded personal income tax, which is typically broad-based, and relates to multiple sources of income. A method had to be developed to break down revenue from personal income tax by economic function (i.e. labour, capital and consumption). This section describes the methods used by the Member States to generate estimates of this split of the personal income tax from tax return data. The methods attribute personal income tax to four main taxable income sources (see Box F.6).

Box F.6: Broad definition of the selected income sources
\(\left.$$
\begin{array}{ll}\text { Income source } & \text { Type of taxable income components included } \\
\text { Employed labour } & \begin{array}{l}\text { Wages and salaries } \\
\text { Fringe benefits in kind } \\
\text { Directors' remuneration }\end{array}
$$ <br>
Foreign source earned income <br>
Financial participation schemes (e.g. stock options) <br>

Deemed income from private uses of company cars\end{array}\right]\)|  | Income from unincorporated businesses <br> Profits from trade or business and proceeds from independent professional services <br> (e.g. dividend distributions from closely held companies) |
| :--- | :--- |
| Capital labour | Income from movable property (e.g. dividends, interest, distributions, royalties) <br> Income from immovable property (rents earned on letting a private dwelling, etc.) <br> Periodic transfers and private pensions |
| Taxable capital gains for some Member States |  |
| Other (e.g. rental value owner-occupied housing) |  |

The resulting estimates of the personal income tax revenue that could be attributed to these taxable income sources are used in the numerators for the implicit tax rates on labour and capital (using relevant aggregate economic incomes as denominators) and in the breakdown of taxes across the economic functions (i.e. taxes on consumption, labour and capital, as a percentage of GDP).

## The flaws of aggregate data and advantages of micro data

Under an approach using only aggregate data, total personal income tax raised in respect of labour (capital) income is often estimated as the proportion
of aggregate labour (capital) income in the aggregate taxpayer income. Another approach is to estimate a single average effective income tax rate on the basis of aggregate data. The total personal income tax revenue data is divided by the aggregate approximation of labour and capital income in the economy to get the overall effective personal income tax rate, which can subsequently be applied to the labour (capital) income in order to estimate the income tax levied from labour (capital) income ${ }^{(24)}$. This ignores the fact that effective

[^96]rates on personal income tax vary across different taxable income components and groups of taxpayers. Even where, for example, labour and capital income are pooled together for tax purposes at the individual level, such an approach may be criticised where aggregate labour income is believed to be subject, on average across taxpayers, to a significantly different average effective tax burden than capital income ( ${ }^{(25)}$. A main concern associated with average effective (implicit) tax rate analysis is the manner in which estimates are derived for the aggregate amount of personal income tax revenue raised from different types of income included in a given country's personal income tax base. Under an approach using only aggregate data from national accounts, for example, total personal income tax raised in respect of labour (or capital or other forms of personal taxable income, for example social transfer or pension income) is often estimated as the proportion of aggregate labour (or capital) income in the aggregate taxpayer personal income. This approach implicitly assumes that labour and capital income (or other forms of taxable income) is subject to one (common) average effective tax rate ${ }^{\left({ }^{26}\right)}$. This assumption is generally unrealistic, and could be expected to lead to imprecise estimates of notional tax revenues raised in respect of different taxable income types and, therefore, imprecise estimates of average effective tax rates by economic income source $\left({ }^{(27}\right)$.

Relying on micro-level data - that is, confidential tax data at the individual taxpayer level - Member States are able to generate more accurate estimates of personal income tax revenues raised on separate sources of income. Generally, capital income will tend to be concentrated at the right side of the Lorenz curve and therefore, be subject to higher marginal and average tax rates as compared to income from labour. On the other hand, special tax concessions may apply to income from capital, so that the average tax rate for capital income might not be significantly different from that for income from labour. For example, some Member States apply a so-called 'dual' income tax system, in which capital income is usually taxed at a relatively lower (fixed) rate as compared to other earned taxable income. Forcing the latter assumption (of special tax concessions) on the data would however be a shortcoming to the analysis. Also, most Member States tend to tax pension benefits or social benefits more favourably than earned income from labour, either by way of increased tax allowances or tax credits that are age-based, or by partial exemptions from the tax base. Using micro-data sets that include separate reported figures at the taxpayer level for the

[^97]items of income on which the personal income tax is raised, it is possible to account for such effects ${ }^{(28)}$.

## The methodological approaches

Most Member States basically multiply individual income tax payments by proportions of the selected income sources in the total taxpayer's income (Belgium, Denmark, Germany, France, the Netherlands, Ireland, Luxembourg, Finland and Sweden). This is done both by way of micro-simulation models relying on samples from the total taxpayer population and by way of use of exhaustive tax return data sets (e.g. Belgium and Ireland). The corresponding estimates obtained at the taxpayer level are consequently aggregated to obtain estimates of the personal income tax raised in respect of the selected sources of income. For example, the total amount of personal income tax raised in respect of labour income, PIT (labour) could be estimated as follows:

$$
P I T(\text { labour })=\sum_{j}\left(W_{j} / Y_{j}\right) * P I T_{j}=\sum_{j} w_{j} * P I T_{j}
$$

where $W_{j}$ measures the labour income of the $j$-th taxpayer in a sample of individuals $(j=1, \ldots n)$ and where PIT measures the personal income tax payment of the $j$-th taxpayer on his total taxable income $Y_{j}$. The above equation therefore measures the total personal income tax raised on labour income as a weighted average of each individual taxpayer's payment PIT, with the weights $w_{j}=\left(W_{j} / Y_{j}\right)$ attached to these individual payments reflecting the distribution of total wages and salaries across taxpayers.

Some Member States (Spain, Italy and Greece) instead use tax return data that is aggregated at the level of a number of income classes or income tax brackets ( $\mathrm{j}=1, \ldots \mathrm{n}$ ), but essentially make the same calculations. The latter approach is likely to capture broadly comparable effects of the differences in tax treatment and the distribution of income sources across different groups of taxpayers.

Some Member States (Austria, Portugal) choose another approach and use tax receipts data from the wage (withholding) tax and (final) income tax statistics and apply a number of adjustments. Wage (withholding) tax

[^98]is by its very nature designed to approximate the final income tax liability for wage earners as closely as possible, but in some cases there are certain adjustments for income tax assessments, because the wage tax withheld is not correct (e.g. because of different jobs or pensions during a single year). As this correction concerns only wage earners, in some cases the net amount of the correction is deducted from the total amount of recorded wage tax and, the amount of personal income tax is adjusted accordingly. Since wage tax can also be levied on social benefits (e.g. unemployment benefits, widower's benefits and invalidity benefits) or old-age pensions, the recorded wage tax is adjusted accordingly. The (adjusted) personal income tax is further split between income from self-employed businesses and capital income, either using aggregate proportions or information aggregated at the level of income classes (Austria). The latter approach is also likely to capture broadly comparable effects of the differences in tax treatment and the distribution of income sources across different groups of taxpayers as outlined above.

Finally, Hungary (from 2009 onwards) uses a combination of micro simulation and a correction on the aggregate figures from the micro simulation model.

While in most Member States the personal income tax system is comprehensive in the sense that all subcategories of taxable income are pooled at the individual level, and the result is taxed at ascending statutory tax rates. However, some Member States apply a given statutory rate on a specific income category, as can occur under a 'dual income tax' system. In the Netherlands, Finland and Sweden, for example, capital income is currently taxed at a relatively lower statutory rate as compared to other earned income. In most cases, however, the tax receipts data are used to isolate the amount of tax collected on that particular income category. In Slovenia, capital income is taxed according to a flat rate while active income is taxed according to a progressive rate. In the United Kingdom, the personal income tax law actually prioritises the order of different types of income. For example, labour income is treated as the bottom of the taxable income and dividend income is treated as the top slice of taxable income. Unlike the method used in other Member States, the United Kingdom calculation therefore does not assume that the individual taxpayer has the same average effective income tax rate over all income sources (see also above). Instead, income source specific income tax rates are multiplied by the selected income sources at the taxpayer level.

Box F.7: Overview of methods to estimate the allocation of the personal income tax

| Countries | Data | Basic method |

## Credits and deductions

Income sources are, insofar as it is possible, measured net of tax base deductions or allowances that are exclusively earned on these income sources (e.g. allowance for savings, expenses incurred in maintaining labour income). This is important, as tax breaks and concessions given in respect of the tax on capital income can be quite substantial, with the result that the estimated fraction for personal income tax raised on capital income can be rather low, and in some cases even negative (e.g. in the Netherlands and in Denmark). It is generally attempted to allocate income-specific tax credits (e.g. an additional tax credit that is earned exclusively on income from labour)
to the base for splitting purposes to which it relates. Against this, the revenue effects of general tax base deductions and credits are proportionately allocated across all income sources. Further complications in calculating the bases for splitting arise due to the fact that certain income tax receipts are collected at source and certain tax breaks are granted at source, whilst others are collected and granted in the framework of the individual taxpayer's tax return. This is particularly an issue with certain components of capital income (interest, dividends, pensions, etc.). There are further conceptual and practical issues with pensions and the self-employed to which there are no easy answers.

As a result of data set limitations and a degree of inconsistency between the approaches adopted by the Member States (which affects most notably the allocation of income tax to capital and social transfers and pensions), the accuracy and comparability of the estimates of the ITRs on labour and capital have been somewhat compromised. The sources of these inconsistencies are various. In some Member States, for example, tax return data are only available at incomeclass level rather than at the taxpayer level. For some countries not all the taxable benefits from social security or old-age pension schemes could be separately identified from the tax return data. Some Member States could not incorporate the revenue effects of tax base deductions or tax credits specifically related to the main income sources. Inconsistency may also arise where Member States permit a joint assessment of the taxable income of the household (e.g. in France before 2001). To give an example, the principal earner of the household may earn labour income whereas the spouse is actually a social benefit recipient with a relatively lower income. In these cases, however, the same effective tax rate was applied to the taxpayers jointly assessed. There are further conceptual and practical problems with the treatment of pensions for which there are no straightforward solutions.

Some Member States were not able to provide full time-series coverage for all calendar years. In these cases, a trend has been assumed using simple linear interpolations, or the fractions were assumed to remain constant. Where the latest available year was not available, the previous year's split was used. In reality changes in the fractions would reflect changes either in the distribution of income or in the tax parameters. Applying linear interpolation seems a valid method only in the absence of major tax reforms.

Apart from certain simplifying assumptions and estimates of the share of personal income tax limited to specific years this new treatment of the personal income tax is a major improvement on the methodology used prior to the 2003 edition. It is found to be vastly better than an approach based on aggregate data in estimating the tax burden on non-wage income sources (in particular for social transfers and pensions and selfemployment income).

## Individual country approaches by type of approach:

## (A) Approach using micro-tax receipts data

- Belgium: The split of the personal income tax was estimated by the Ministry of Finance using detailed revenue statistics from the national tax administration based on individual tax returns. The data set covers any assessed income, and is exhaustive. In fact, the national tax administration already splits and allocates the
aggregate personal income tax revenue raised on the so-called'global income'to the different income sources on a case-by-case basis, in order to derive entitlements of individual taxpayers to certain tax credits that are related to specific income sources. For example, the tax credits for pensions, sickness or unemployment are limited to the income tax that relates proportionally to the corresponding net income. This allocation of the tax revenue raised on the 'global income' is calculated by multiplying individual tax payments by proportions of the income types in the total taxpayer's 'global income', as outlined above. The income types are measured net of tax base deductions that are exclusively earned on these income types. Subsequently, the estimated fractions of the aggregate personal tax revenue that is raised on the selected income types depend on a proportional division of the personal income tax that is due on the 'global income' and the income tax due on 'distinct income' sources that are taxed separately. The resulting fractions are consequently applied to the sum of revenues from advance payments on earnings, advance payments of tax on self-employed persons and the amount of the final income tax assessment. The revenue from withholding tax on income from movable capital and real estate tax is not included in the above calculations; they are directly assigned to the capital income.
- Denmark: The split of the personal income tax was estimated by the Ministry of Taxation using a microsimulation model that is based on a sample of micro (taxpayer-level) data. The model incorporates the information of withholdings/prepayments and final income tax returns. The model is updated annually, and used in planning the national tax policies and estimating policy alterations on tax revenues and on the income tax liabilities of taxpayers on different income levels. The model also covers other legislative areas, such as unemployment benefits, housing subsidies, social assistance and so on. The method basically multiplies individual tax payments by proportions of the income types in the total taxpayer's income, as outlined above. The income types are measured net of tax base deductions that are exclusively earned on these income types. By including net interest payments in the tax base of capital, for example, the Ministry of Taxation has taken into account the way the tax relief for mortgage interest payments and other interest payments on loans reduces the tax base of capital. This explains why the estimated part of capital income may be lower than zero. The method takes into account that from 2001 onwards negative capital income can only be deducted in the local income taxes (and from 2007 the so-called health care contribution as a consequence of the municipal reform) and that from 1998 to 2001 the after tax value of the deduction for negative capital income was gradually eroded. The so-called share income (which is taxed separately) is allocated directly to the part on capital income. As regards employed
labour income, it should be recognised that in 1995 and 1999 wage income was taxed as follows: on the one hand the tax base for the municipal income tax and the lower limit central government tax was wage income less transport expenses and unemployment insurance contributions; on the other hand the tax base for the so-called middle bracket and top bracket income tax was the part of the wage income - without any reduction for expenses - that exceeded a certain amount. If one reduces the tax base with deductible 'wage expenses', then the part of the mean limit and an upper limit income tax that is attributed to wage income is too small. Whereas if it is not taken into account the part of the municipal income tax and lower limit central government tax that is attributed to wage income is too big. The Ministry of Taxation has chosen the latter approach as it is believed that the bias will be the smallest in this case.
- Germany: The split of the personal income tax was estimated by the Federal Ministry of Finance using a micro-simulation model. This model is based on a representative sample of micro (taxpayer-level) tax return data that is used for tax forecasting purposes and pre-assessing the consequences of changes in income tax legislation. In addition, the model allows the assessment of the solidarity tax, child benefits, the church tax and social contributions. The simulation model incorporates the information on withholdings/ prepayments and final income tax returns (in Germany, nearly every private household liable to income tax must file an income tax return, employees only paying wage withholding tax are also included in the sample). The calculations do not take into account child benefits and tax-free cash grants for acquiring or constructing new occupational dwellings, which are credited against the income tax liability. These transfers are deemed as separate transfers in the context of social policy programmes. Basically, personal income tax payments were multiplied by the selected income sources at the micro level, as outlined above. The income sources are measured net of tax base deductions that are exclusively earned on these income sources. Germany employs a comprehensive income tax base. There are no incomespecific rates such as lower flat-rates on income from capital investment as in countries with dual income tax systems, nor does Germany grant lower tax rates or tax credits on low wages. However, the tax base may be largely offset by income-specific allowances (such as the saving allowance), tax incentives or arrangements in computing income, but these effects are captured within the calculations, because the average effective tax rate is multiplied by the net taxable income sources.
- Ireland: The split of the personal income tax was estimated by the Inland Revenue using an exhaustive data set with micro (taxpayer-level) tax return data. The data set covers all taxpayers for which a return was received. The method basically multiplies individual
tax payments by proportions of the income types in the total taxpayer's income, as outlined above. However, because there are some taxable personal income components that are taxed at a flat rate only, there is no actual split of tax revenues raised on these particular income components. The tax raised on such components is directly calculated from the tax return data. At this stage, the income types are not yet measured net of tax base deductions that are exclusively earned on these income types. This could be done in future updates of the split of the personal income tax.

France: The decomposition of the PIT was based on a sample of around 500000 tax declarations (2 \% of the total). The method basically multiplies individual tax payments by proportions of the income types in the total taxpayer's income. The income types are measured net of tax base deductions that are exclusively earned on these income types. In addition, corrections were made for the revenue effects of tax credits that are exclusively earned on the selected income types (e.g. the payable tax credit, the prime pour l'emploi, to encourage low-paid and low-skilled workers to resume active employment). It is worth noting that France employs a joint assessment of the taxable income in the household. For example, the principal earner in the household may earn labour income whereas the spouse receives social benefits, but the total amount of personal income is jointly assessed. In the calculations for the split of the personal income tax, however, in this case the same effective tax rate has been applied to the partners jointly assessed. For the period 2001-2004 data provided by French authorities also include taxes paid on transfers. For the period 1999-2000 this was only possible if the household income included salary or self-employed labour revenues. In order to maintain comparability and consistency in the time series the split for 1999 and 2000 has been adjusted. Assuming that the changes in the shares from 2000 to 2001 are only due to the introduction of the category 'transfers', the absolute changes for the other three categories have been calculated accordingly and deducted from the original values provided. For the period since 2012 the PIT split computation has been further refined. The split is now computed according to the breakdown of net taxable income (and not the reported income). For example, for salaries and wages it is the amount once the deduction for business expenses is taken into account. The new ESA 2010 is applied to the split calculation, with refundable tax credits now included in public expenditure instead of lowering the PIT amount. Real estate capital gains and the mandatory standard deduction (PFO) are also taken into account and are directly assigned to KIH. Finally, in order to have a precise breakdown of d51A by economic function, a different split is computed for each tax concerned by the split (D51AA-other taxes, D51AC-CRDS, D51AD-CSG, D51AFother social levies, D51AG-personal income tax). These
corrections introduce a break in the PIT series for France, notably for the shares of capital income of households and self-employed although the total share of capital remains almost unchanged.

- Latvia: The split of the personal income tax was estimated by the Ministry of Finance. Latvia's calculations are greatly simplified by the existence of one single rate of personal income tax. The calculations were based on data from personal income tax returns, in accordance with the individual taxpayers' data. The summary of salary declarations was used to calculate personal income tax revenue from employed labour income. Information on the personal income tax paid by the self-employed was derived from the Declaration of annual income and from the advance payment tax return. Information on tax on pension payments was obtained from the State Social Insurance Agency. The lack of any records of personal income capital taxation means that this amount was taken as the residual. A part of allowances (the non-taxable minimum and allowances for dependants) is applied at the moment of the tax calculation. The tax is collected, taking into account applicable allowances. Information on the applicable allowances is obtained from the tax returns. The other allowances are obtained only after submission of declarations of annual income to the State Revenue Service. The total PIT revenue is already shown in net form i.e. the PIT repayments made by the State Revenue Service are already taken away.
- Luxembourg: The split of the personal income tax was estimated by the National Statistical Office using detailed revenue statistics from the national tax administration (ACD) based on exhaustive household tax returns (in Luxembourg PIT is based on family taxation) and on withholding revenues on employed labour and transfers. For the part on tax returns, the method basically multiplies individual tax payments by proportions of the income types in the total taxpayer's income, as outlined above. Then the withholding revenues were considered, because it is not mandatory to compile tax return if there is only employed labour or pension income. Since the distinction between withheld amounts raised on labour employed and pension income is not available, data from the social security organisations were used. When only the total amount withheld was available from a social security organisation, the average rate of contribution was used as a proxy.
- Hungary (from 2009): The split of the personal income tax is based on a combination of a micro simulation using all individual tax returns and a correction on the aggregate figures from the micro simulation model. First, the distribution of the PIT revenue attributed to the four income types is derived for each individual, then it is aggregated across all taxpayers. Finally, PIT on incomes taxed at source (they include fringe benefits and most of the taxed interest income, and
are not reported in the annual tax returns and were not included before 2009) is added to the relevant categories and the final PIT split is calculated from these revenue figures.
- Malta: The split of the personal income tax is based on the actual data available at the local tax authorities through the individual returns. When returning their annual declarations, all taxpayers are obliged to correctly indicate the exact source of their income on their individual tax form. This information is then captured at micro level, and is used to compile the figures submitted in the national PIT questionnaire. There is no further extrapolation on the data, except for the case of the withholding taxes on capital. Since the withholding tax is a flat percentage, this figure has been obtained based on the revenue generated from this particular source.
- The Netherlands: The split of personal income tax is estimated by the Ministry of Finance using a updated micro-simulation model that is based on a sample with micro (taxpayer-level) data. For the 2016 edition, some methodological changes were made, most notably regarding compulsory payments for the Cure Insurance Act which are now included in the split of the social contributions. In order to ensure a consistent series over time, the split of the personal income tax has been recalculated for all years since 2002. The microsimulation model used covers the combined tax burden of wage withholding tax, personal income tax, social contributions and wealth tax. The method multiplies individual tax payments by proportions of the income types in the total taxpayer's income, as outlined above. In the Netherlands, the lowest two income tax rates consist of personal income tax and social contributions; the highest two rates consist solely of personal income tax. The split has therefore been computed for both personal income tax and social contributions (which are in principle levied on all taxable personal income types). The income types are measured net of tax base deductions that are exclusively earned on these income types. The compulsory net payments to the healthcare fund are split based on the number of people with employed labour, self-employed labour and transfers and are attributed to the social contributions. A special provision applies to the capital income of owneroccupied property. This is taxed at a notional rental value, which represents the balance of revenue and expenses connected with the use of the dwelling, and is assessed using statutory tables. As normal expenses are included in the notional rental value, no expenses other than mortgage interest and ground rent may be deducted. The deduction for mortgage interest payments explains why the estimated part of capital income is negative.
- Poland: The split of the personal income tax was estimated by the Ministry of Finance. Poland has a progressive tax system, hence the estimate is obtained
with a bottom-up methodology, starting from taxpayer-level data and the aggregating the results. For taxes levied as lump sums, the method used simply multiplies the individual tax due by proportions of the income types in total taxpayer's income. The income types are measured net of estimated social contributions. Adjustments were made for married couples'tax returns (their joint income was used in the calculations). Owing to an important reform in 1999, which introduced tax-deductible health insurance contributions, there are two different methodologies for the years 1995-1998 and 1999-2004. For the years after 1999, the Ministry of Finance arrives at the PIT due by subtracting the amounts due as health insurance contributions from the total revenue and the residual then represents the amount due for the PIT. The amounts due for the health insurance contributions are then split across economic functions and reintroduced in the PIT split so that the final PIT split given is homogeneous across the entire time period.
- Slovenia: The split of the personal income tax was estimated by the Ministry of Finance. The calculations were based on data sets for individual taxpayers, except in the case of pensions. As most of the PIT from pensions is only accounted for but not collected the PIT from pensions is subtracted. Actual PIT collected from pensions is very close to prepayment of PIT from pensions during the year. Therefore, these prepayments are added to PIT from the transfer and pensions category. The method multiplies PIT payments by fractions of net taxable income sources (as a percentage of the total tax base) at the level of individual taxpayers. The allowances were deducted at the individual level (except in the case of pensions). In 2006, major changes in the PIT system were introduced - schedular system for capital income was introduced and tax prepayments became final payments. This reform resulted into two different sets of data for 2006: accrual individual data for employed labour income, self-employed income and social transfers and pensions; and cash cumulative data for capital income.
- Finland: The split of the personal income tax was estimated by the Ministry of Finance using a microsimulation model that is based on a sample of micro (taxpayer-level) data. The information is collected by Statistics Finland. The model is updated annually, and used in planning the national tax policies and estimating policy alterations on tax revenues and on the income tax liabilities of taxpayers on different income levels. The method basically multiplies individual tax payments by proportions of the income types in the total taxpayer's income, as outlined above. However, because of the dual income tax system, there is no actual split of tax revenues raised on capital income. The tax raised on capital income is directly calculated from the tax return data. The income types are measured net of tax base deductions that are exclusively earned on these
income types. The statistical information on dividend income in the model contains both dividend income of the self-employed that is treated as the capital part of the income, and the dividend income from investors, that is not income from self-employed labour but capital income from for example owning shares in a listed company. The statistical information is split into dividend income from self-employment and dividend income from saving and investments using an estimate. From year 2002 the method of splitting dividend income between dividends from listed companies and the dividends of the self-employed owners has been improved. Mortgage interest payments are not deducted from the capital income, since no rental value taxation of income from home-ownership is applied.
- Sweden: The split of the personal income tax was estimated by the Ministry of Finance using micro-simulation models that are mainly based on administrative sample data. The models are updated annually, and mainly used in planning the national tax policies and estimating policy alterations on tax revenues and on the income tax liabilities of taxpayers on different income levels. The method basically multiplies individual tax payments by proportions of the income types in the total taxpayer's income, as outlined above. However, because of the dual income tax system, there is no actual split of tax revenues raised on capital income. The tax raised on capital income is directly calculated from the tax return data. The income types are measured net of tax base deductions that are exclusively earned on these income types. An alternative way to describe the method is to say that the individual specific average effective income tax rate is calculated to split the personal income tax across different taxable income sources. Note, however, that these average effective tax rates are computed while incorporating the revenue effects of tax credits that are exclusively earned on the selected income sources. The revenue effects of general tax credits for all taxpayers are proportionally allocated across all selected income sources.

Norway: The split of the personal income tax was estimated by the Ministry of Finance using a microsimulation model called LOTTE. The model is based on a sample from the household income statistics of Statistics Norway. The personal income tax system has two tax bases: personal income, from which no deduction may be made, and ordinary income. Ordinary income includes all types of taxable income from labour, transfers, business and capital. Certain costs and expenses, including interest paid on debt, are deductible in the computation of ordinary income. Dividends are regarded solely as capital income in the calculations. With the exception of the standard allowance, the basic allowance and the allowance for gifts to voluntary organisations, all allowances are entirely allocated to one income source. The basic allowance is calculated
as a certain percentage of wage and pension income with a lower and upper limit. In the calculations, the basic allowance is divided according to the size of wage and pension income, respectively, for each individual. Some basic allowance is reported separately for spouse supplementary pensions, child alimonies and pensions. These are allocated to transfer income. The allowance for gifts to voluntary organisations is a general allowance and is as such divided on all income sources. The SC and the central government income surtax are separated between the relevant income sources (labour, self-employed and transfer). The labour and transfer component in gross income is identified by the LOTTE model. Self-employed income is more difficult to identify because of some special limitation rules for this category of income included in the personal income tax base. Actual self-employed income might therefore be higher than the taxable self-employed income included in the gross personal income tax base. However, by hooking the LOTTE model to total gross personal income reported in the tax statistics, it is possible to identify the self-employed income in the tax base (by subtracting labour and transfer income from total gross personal income).

## (B) Approach using both micro and aggregate tax receipts data

The method employed in the United Kingdom is based on combining micro and aggregate tax record data. Also, unlike the methods outlined above, the method does not assume that the individual taxpayer has the same average effective income tax rate over all income sources. Instead, income source specific tax rates are multiplied by the selected income sources at the taxpayer level.

- The United Kingdom: The split of the personal income tax was estimated by Her Majesty's Revenue \& Customs using a micro-simulation model and aggregate tax receipt data. The micro- simulation model incorporates the information of withholding taxes (PAYE), self-assessment tax returns and claims by non-taxpayers for overpaid tax deducted at sources. The method does not assume that the individual taxpayer has the same average income tax rate over all selected income sources. Instead, income-source specific tax rates are computed, because the personal income tax law prioritises the order of different types of income. For example, labour income is at the bottom of the taxable income and dividend income is treated as the top slice of the taxable income. The total tax liability that results from the micro-simulation model, grossed up to the total taxpayer population for sampling, does not exactly correspond to the total recorded tax receipts from macro-tax receipt data, due to differences in definition and sampling error. The main differences between the micro and macrotax receipt data occur because some components (i.e. company income tax and unallocated tax receipts) are
not modelled. Also, there are various repayments of personal income tax which are made directly at source and are not captured in the model data, including payments to pension funds, charities, special savings schemes, life insurance relief, mortgage interest relief at source, child tax credits, working tax credits and vocational training relief. These elements of the macrotax receipt data have also been allocated across the selected income types, whenever this was possible.
(C) Approach using tax return data aggregated at the level of income classes or tax brackets

In some Member States tax return data is used that is aggregated at the level of a number of income classes or tax brackets. Basically, the recorded personal income tax payments are multiplied by the selected income types over the sum of the taxable personal income sources at the level of income classes or tax brackets. This approach thus implicitly assumes that a (common) average effective tax rate applies to all selected income types at the level of the income class. The corresponding estimates are consequently aggregated to obtain the estimate of the split of the personal income tax. Calculations by Italy have shown that differences from using either macro-tax return data or micro data aggregated by income classes turn out to be significant for the taxable personal income types that are less important from a quantitative point of view. Although the method cannot provide the degree of accuracy of micro (taxpayer-level) data, it is believed that is likely to capture the effects of progression of the personal income tax system and the distribution of income sources across different groups of taxpayers.

- Bulgaria: The split of the personal income tax was calculated by the Ministry of Finance using information from the tax returns filed in the National Revenue Agency, representing aggregated micro data per tax return. The tax base of the different types of income besides labour income is divided over the total tax base and the ratio serves as weight to measure the share of the relevant income in the total tax due. The sum of the weighted tax revenues shall be the tax due for all income except labour income. For employees receiving only labour income, the PIT is withheld by the employer. The share of every type of non-labour income mentioned before is applied to the cash revenues from all types of income besides labour income. The revenues from labour income and from non-labour income form the total revenues. The share of the labour income revenues in total PIT revenues is known, the share of the total non-labour income revenues in total PIT revenues is also known, as well as the share of each type of non-labour income within the total non-labour income revenues. The relevant shares serve as the PIT split.
- Greece: The split of the personal income tax was estimated by the Ministry of Finance in cooperation with EL.STAT and Professor Geogakopoulos from the

Athens University of Economics. The calculations were based on data from personal income tax returns, which were grouped by category of income and tax bracket. Basically, the method multiplies tax payments by proportions of the income types in the total taxpayer's income, as outlined above, but aggregated at the level of income classes. The income types are measured as net taxable personal incomes. In order to split between income from employed labour and transfers data from the General Secretariat of Information Systems were used. The final percentages are comprehensive of tax on savings, which is included in category D.51a in addition to tax revenue from personal income tax; the total amount of this category constitutes tax on capital and, given that this tax is not calculated on the total income of households, it was added to income tax from capital in the calculations.

- Spain: The split of the personal income tax was estimated by the Ministry of Finance and the methodology was revised as of 2010. The estimates are covering not only PIT taxpayers' population those who submit a PIT return - but even those PIT taxpayers not directly obliged to do so but whose contribution to the tax is made only through monthly withholding taxes and advance tax payments. The allocation of tax liabilities arising from earned income - wages and social benefits - is made directly through observed advance tax payments data files rather than calculating the weights based on the values of such income in accordance with the Spanish National Accounts (CNE), as it had been done until 2010. This latter change appreciably affects the final estimates and now reflects much more accurately the allocation of each of those income sources, since, as noted repeatedly in previous years, CNE data overstates the tax burden of pensions and other social benefits in the PIT. This is because it is not possible to deduct those pensions exempt from the tax, and furthermore under the former methodology it was not possible to take into account the different effective tax rates applied to both salaries and pensions, given that pensions usually pile up in lower income levels and therefore its taxation is substantially lower when applying a progressive tax schedule. Therefore, as of 2010 only tax data provided by the Spanish Tax Administration is used. The methodology is divided into three basic stages: (1) the final tax liability (by income sources) from PIT filers is directly obtained from tax data records broken down into 47 income brackets; (2) for non-PIT filers the final PIT tax liability distribution is obtained as the difference between the total amount of periodic withholding tax payments (filers and non-filers) and the advance payments of the latter obtained through annual tax returns submitted by third-parties; (3) the allocation of final tax liabilities arising from earned income among wages/salaries and social benefits is directly obtained through the annual observed tax statistics covering the whole tax population (filers and
non-tax filers) related to periodic withholding and advance tax payments, and according to their own weight.
- Italy: The split of the personal income tax was estimated by the Ministry of Finance using a micro-data set containing IRPEF tax return data for all taxpayers. Instead of computing an average tax rate for each individual taxpayer, the information was allocated to 35 classes of gross income. Basically, the recorded personal income tax payments were multiplied by the selected net taxable income sources over the sum of the net taxable income sources at the income class level. The income types are measured net of tax base deductions that are exclusively earned on these income types. In addition, corrections were made for the revenue effects of tax credits that are exclusively earned on the selected income types. In addition to the recorded IRPEF tax revenues, IRPEF payments received by the treasury on denominations other than IRPEF were incorporated in the calculations. These include tax on dividend distributions and dividend withholdings, which were directly allocated to the capital income category. As from 2015, the labour cost concerning permanent contract workers is not included in IRAP Tax Base. The IRAP split is estimated on the basis of tax returns so taking into account the labour cost deduction. On the other hand, 2015 IRAP revenue data might not fully reflect the legislative change because of the tax advance payment system IRAP revenues will probably decline substantially in 2016. So, the capital component amount of IRAP will be overestimated in 2015 and underestimated in 2016.
- Cyprus: The split of the personal income tax was estimated by the Ministry of Finance. The calculations were based on tax assessment data, which were grouped by category of income and by tax bracket into 26 income classes. The recorded personal income tax payments are multiplied by the taxable income sources for each class and then divided by the aggregate taxable income of the class. The income types are measured as net taxable personal incomes. All deductions have been allocated to the correct base class and category for the purposes of the split. The personal allowances have been allocated in proportion to the income sources.
- Lithuania: The split of the personal income tax was estimated by the Ministry of Finance utilising data from the State Tax Inspectorate. Data coverage is very high ( $99.9 \%$ to $100 \%$ of actual payments by the different revenue group of personal income tax). Lithuania's calculations are simplified by the existence of a dual rate system for earned and unearned income. The categorisation of income taxes allowed most elements to be allocated to their economic functions without need for further individual or income class breakdowns. The split of personal income tax calculation breaks down the total amount of the tax
refund across the various revenue groups. Payments from non-employment related or n.e.c. income were attributed to the payments from capital and income from individual activities, in proportion to the interrelation between respective incomes calculated according to tax return data. Adaptations to the methodology were done from 2002 to 2003 as a result of changes in the legislation which allowed deductions for life insurance and pension contributions and for certain interest payments. Note for the year 1999 data limitations required a special estimate which was based on a different methodology.

Taxes and social contributions paid by the self-employed are allocated to the capital and business income category ${ }^{\left({ }^{29}\right) \text {. Italy proposed to split tax revenues from }}$ income of self-employed in $80 \%$ and $20 \%$, because most of the self-employed in Italy are more comparable to dependent employed workers. The $80 \%$ are related to labour and the $20 \%$ are linked to capital income of self-employed. The mixed income of self-employed should be split accordingly. Social contributions of selfemployed are attributed to labour in the Italian method.

## (D) Approach using aggregate withholding tax and final assessment income tax data with certain adjustments

In some Member States the estimates of the split of the personal income tax were computed on the basis of aggregate statistics of withholding tax and the final personal income tax by assessment.

- Czech Republic: The split of the personal income tax was estimated by the Ministry of Finance. Three PIT accounts exist; the first, wage tax withheld by the employer is purely labour, the second, withholding tax, is presumed to be purely capital, and the tax paid per tax return was split. The calculations were based on data from personal income tax returns, which were grouped by category of income and by tax bracket into 20 classes. The method multiplies tax payments by proportions of the income types in the total taxpayer's income, aggregated at the level of income classes. The income types are measured as net taxable personal incomes. In calculating the split between income from employed labour and transfers, it was found that almost all the transfers were tax exempt ( $0.001 \%$ of the total PIT revenue) so all were allocated to employed labour. All deductions have been allocated to the correct base class and category for the purposes of the split.
- Estonia: The split of the personal income tax was estimated by the Ministry of Finance using micro-level data from the income tax returns and withholding

[^99]tax statistics. Different approaches were used for determining the PIT splits depending on data availability. Thanks to the very good quality and detail of the data for 2004, the split for this year is the most thorough. Firstly, withholding tax returns were used to derive the split in the case of resident natural persons who didn't submit the 2004 income tax return. As in the case of withholding tax returns the income is already divided between 19 different income categories, the data was grouped between income from labour, capital and transfers. Secondly withholding tax returns, where payments to non-resident natural persons are declared and divided into 11 different income sources, were used and the PIT split obtained. In both cases the allowed deductions are taken into account finding the PIT split. In the third step, based on the income tax returns, firstly PIT from self-employed labour was estimated. As from 2004, the increased basic exemption in event of pension is declared on the income tax return; it was assumed that only resident natural persons who are entitled to pension declare it and would be able to use this deduction. In the case of other income sources, i.e. income from Estonia, gains from transfer of property, other income and income from abroad, all the deductions (including basic tax allowance) were allocated proportionally over the income sources, except the special deduction for self-employed persons in agriculture, which was allocated to their income. The split for the years 2001-2003 was made based on withholding tax returns of non-resident natural persons and on income tax returns. The estimates concerning 1996-2000 were made based solely on the income tax returns data.

- Hungary (before 2009): The split of the personal income tax was estimated by the Ministry of Finance using aggregate statistical information from individual personal income tax returns and the declarations of enterprises on withholding tax. The share of the personal income tax on labour is related to the total revenue from the personal income tax by deduction of shares pertaining to capital and to self-employed income together with a weighted proportion of the tax credits from the latter.
- Austria: The split of the personal income tax was estimated by the Ministry of Finance using statistical information from the wage withholding tax and the final income tax by assessment. Taxes raised on income from employed labour are withheld by the employer at source, and the wage tax system is designed to approximate the final personal income tax as closely as possible, but in some cases certain repayments have to be made by the tax administration. This can for example occur if the taxpayer receives income from several jobs or pensions during one year, or if there are different payments per month or deductions for special expenses etc. As these repayments concern only wage taxpayers, the total net amount of the repayments was
deducted from the total recorded wage tax, and the recorded income tax was adjusted accordingly. Also, the income from employment includes income in the form of social transfers and pension benefits received. The recorded revenue of the wage tax was also corrected for the relevant amount to arrive at the fraction of income tax levied on labour income. The revenue of the personal income tax by assessment largely reflects entrepreneurial income and income from capital. The (corrected) recorded revenue from the personal income was split between the two sources, using tax return data aggregated at the level of a number of income classes as outlined above.

Portugal: The split of the personal income tax was estimated by the Ministry of Finance using information from personal income tax returns except for the amount of tax raised on capital income, which was estimated using information of both withholding taxes and personal income tax returns. The estimates are based on three data sets: (1) aggregate net taxable incomes by category of income; (2) tax liabilities by category of income or groups of categories, depending on the type of tax returns. Some households only earn income from one category of income (e.g. income from labour), and so the tax liability is directly imputable to that category but other households simultaneously earn income from more than one category (e.g. income from labour and income from self-employed labour); (3) aggregate data from withholding tax returns relating to incomes subject to a final withholding tax, which, in general, are not reported in tax returns (e.g. interest on bank deposits). The split of the personal income tax was estimated according to the following procedure. As the first step, the tax liability of households with one source of taxable personal income was directly allocated. As the second step, from the aggregates of the net taxable incomes by category of income the net taxable incomes of households with one source of income were subtracted. Third, the aggregate tax liability of households which earn more than income was split. This split was made in proportion to the aggregate taxable incomes for each category that resulted from the second step. In this step it was thus assumed that all categories of income are subject to a common average
effective tax rate. Finally, the revenue from the final withholding tax was added to the relevant categories. It should be noted that this assumes that none of the incomes subject to a final withholding tax is reported in the tax return and so could result in double counting. However, in practice, it is believed that the amounts concerned are not of great magnitude.

Romania: The split of personal income tax was estimated by the Ministry of Finance in collaboration with the National statistical office using aggregate statistical information of the general personal income tax revenues, and the afferent taxable base, divided on the relevant categories.

## Estimates of the split of personal income tax

The following tables present the resulting estimates for the split of the personal income tax. Looking at the estimates, there are some noticeable differences, in particular for the income tax allocated to capital and social transfer and pension benefits. By including net interest payments in the tax base of capital, for example, some Member States (e.g. Denmark and the Netherlands) have taken into account the way the tax relief for mortgage interest payments and other interest payments on loans effectively reduces the tax base of capital. This explains why the estimated fraction for personal income tax raised on capital income is sometimes relatively low (or even negative) for a number of Member States. In some Member States such deductions are less significant or non-existent, while others were unable to take the revenue effects of such specific tax base deductions yet into account. Also, some Member States were unable to estimate the amount of personal income tax on (taxable) social transfers, while others could not distinguish between different types of pension benefits. Inevitably this may have had some consequences for the implicit tax rates on labour and capital. The estimates for the amount of personal income tax allocated to capital income and social transfers and pensions would benefit from future work. What is also noteworthy from the table is the fact that the personal income tax revenue allocated to (employed) labour income appears to be relatively low in Greece and Poland.

## Effective average tax rate

The methodology used for the calculation of the effective tax rates is set out by Devereux and Griffith (1999, 2003), and has also been used in an earlier study by the European Commission in $2001\left({ }^{(30}\right)$. The methodology has been applied for the calculation of effective tax rates in the EU and other countries by ZEW on a yearly basis ( ${ }^{(1)}$.

The basic approach proposed by Devereux and Griffith $(1999,2003)$ is to consider a hypothetical incremental investment located in a specific country undertaken by a company resident possibly in the same country, but also possibly in another country. Given a post-tax real rate of return required by the company's shareholder, it is possible to use the tax code to compute the implied required pre-tax real rate of return, known as the cost of capital ( ${ }^{(22)}$. The proportionate difference between the cost of capital and the required post-tax real rate of return is known as the effective marginal tax rate (EMTR) ( ${ }^{(33}$ ).

This approach is based on the presumption that firms undertake all investment projects which earn at least the required rate of return. For a given required post-tax rate of return, the more severe the tax system, the higher is the cost of capital, and hence the less likely that any specific investment project will be undertaken.

A complementary approach is to consider discrete choices for investment, and in particular the discrete location choice. If two locations are mutually exclusive, then the company must choose between them. In this case, the impact of taxation on the choice is measured by the proportion of total income taken in tax in each location. Devereux and Griffith $(1999,2003)$ proposed a measure of an effective average tax rate (EATR) ( ${ }^{(34)}$ to identify the effect of taxation on such discrete location choices.

[^104]In both cases, the hypothetical investment takes place in one period and generates a return in the next period. It is assumed throughout that the tax system is expected to remain unchanged over the life of the investment. The impact of taxation depends on a number of features of the tax system, including the statutory tax rate, capital allowances, the treatment of interest deduction, the allowance for corporate equity, the treatment of foreign source income, wealth taxes paid by the company, as well as possibly the treatment at the corporate and personal level of dividends paid by the company, and wealth and capital gains taxes at the personal level.

The forward-looking effective tax rates offer a convenient theoretical framework for summarising at a broad level the interaction of tax rules relating to capital investment. It should be noted that the indicator should be interpreted with caution, taking into account the assumptions related to the hypothetical investment as well as to the modelling detail of the tax systems under consideration. The measures presented here should also be distinguished from backward-looking approaches, as derived from published data on tax payments, either from company accounting records or from tax receipts. The latter offer the advantage that they are based on real-life data, but are subject to a number of limitations when analysing investment decisions: time lags in information and a lack of framework to distinguish between economic effects and tax effects, and the absence of a time perspective.

## A) Economic assumptions

Several assumptions need to be made in order to define the hypothetical investment project analysed in this report, and the economic conditions under which it would take place. The following is assumed:

- The investment is made in the manufacturing sector.
- The shareholder is assumed to be able to earn a real rate of return of $5 \%$ on an alternative investment. If the alternative investment is not taxed, this is also the post-tax return required by the shareholder on the hypothetical investment analysed. Any tax on the alternative asset reduces the required post-tax rate of return on the hypothetical investment.
- The inflation rate is assumed to be $2 \%$ in all countries.
- Separate investments in five different assets are considered. They are as follows, together with the true economic depreciation rate assumed in each case (based on a study from the Ifo Institute in Munich): intangibles (taken for tax purposes here to be the purchase of a patent) (depreciation rate of 15.35 \%); industrial buildings ( 3.1 \%); machinery (17.5 \%); financial assets (zero); and inventories (zero). In presenting averages over different forms of investment, these assets are weighted equally.
- Three sources of finance for investment in each asset are separately considered: retained earnings, new equity and debt. In presenting averages over different forms of investment, weights used are taken from OECD (1991): retained earnings $55 \%$, new equity 10 \% and debt $35 \%$.
- The methodology has been also applied to compute effective tax rates at the shareholder level. Three types of shareholders are considered: zero-rate, top-rate non-qualified and top-rate qualified. In this report the shareholder taxation in the personal income tax is assumed to be zero. Only corporate taxation is considered.

## B) Description of the tax parameters

Common figures to all countries for the real rate of return, the inflation rate, the true economic depreciation on assets and the weights for investments and sources of finance are used in order to identify differences in effective tax rates due to tax regimes, rather than due to differences in underlying economic conditions.

The types of parameters incorporated into the model are as follows:

- statutory corporation tax rates, including surcharges and typical local tax rates on profit, as well as various special rates which apply to specific forms of income or expenditure;
- corporate real estate taxes, net wealth taxes and other non-profit taxes on assets;
- capital allowances for industrial buildings, machinery, intangibles (the purchase of a patent) and the tax treatment of financial assets and inventories.

## HOW TO OBTAIN EU PUBLICATIONS

## Free publications:

- one copy:
via EU Bookshop (http://bookshop.europa.eu);
- more than one copy or posters/maps:
from the European Union's representations (http://ec.europa.eu/represent_en.htm); from the delegations in non-EU countries (http://eeas.europa.eu/delegations/index_en.htm); by contacting the Europe Direct service (http://europa.eu/europedirect/index_en.htm) or calling 0080067891011 (freephone number from anywhere in the EU) (*).
(*) The information given is free, as are most calls (though some operators, phone boxes or hotels may charge you).
Priced publications:
- via EU Bookshop (http://bookshop.europa.eu).

[^0]:    ${ }^{(1)}$ ) The figures used in this report for tax to GDP and for total taxation correspond to the "Indicator 2" definition (see Part 3 - Annex B, Box A.1).
    $\left(^{2}\right)$ Data on tax revenues collected should be used with some caution in the context of analysing the issue of government centralisation or decentralisation. In particular, the breakdown by level of government is in general different depending on whether one looks at tax revenue data, total revenue data, or government total expenditure.

[^1]:    $\left.{ }^{(3}\right)$ For Belgium, two alternative allocations of tax revenue by sub-sector are shown: 'ultimately received tax revenues' and tax revenues as transmitted under ESA2010 rules to Eurostat. For the purpose of compiling the EU and euro area aggregates, the National Accounts definition is used. Use is made of additional data in order to provide "ultimately received taxes" by sub-sectors of general government.

[^2]:    (1) As supplied in ESA2010 National Accounts, as opposed to 'ultimately received revenue'.
    (2) In the ESA2010 national accounts, the social security funds sub-sector is not distinguished for IE, MT, UK and NO.

[^3]:    ${ }^{(4)}$ It should be noted that the country ranking in Graph 6 differ from those for the economic function data in the country tables of Part 2 because the former are expressed as a percentage of total tax revenue, whereas the latter are expressed as a percentage of GDP.

[^5]:    Notes: Rates given in the table are rates applicable (for more than 6 month in the year considered, or) on the 1st July of that year. When change of rates occurred during the year (not on 1 st January) the exact date is available in the notes. Full information on VAT rates is available at VAT - European commission including full information on reduced rates and products to which they are applicable. Bulgaria: Reduced rate increased to $9 \%$ on 1.04.2011

    Estonia: Standard rate increased to $20 \%$ on 1.07 .2009 eneral increase occurred on $15 / 03 / 2010$ (to $5 / 10 \%$ and $21 \%$, followed the same year by the increase to $5.5 / 11$ and $23 \%$, which occurred on July 1 st. Reduced rate increased to $13 \%$ and super reduced rate to $6.5 \%$ on 1.1.2011. Super reduced rate is lowered to $6 \%$ as of 20.07 .2015 . Standard VAT rate raised from 23 to 24 percent, effective as of 1.6.2016.,

    France: Before 01.04.2000, standard rate was equal to 20.6\%.
    Croatia: Standard rate increased to $23 \%$ on 01.08.2009. further inc
    Ireland: Ireland: The (super-) reduced rate was 4\% on 01.03.1999. It in
    Ireland: Ireland: The (super-) reduced rate was $4 \%$ on 01.03 .1999 . It increased to $4.2 \%$ on 01.03.2000.The rate increased to $4.3 \%$ on 01.01 .2001 and it increased to $4.4 \%$ on 01.01.2004.The rate increased to 4.8\% on 01.01.2005 and remains at this rate at present.
    Standard rate increased to $21 \%$ on 01.03 .2002 . Standard rate increased further to $21.5 \%$ on 01.12 .2008 . Standard rate decreased to $21 \%$ on 01.01 .2010 . Standard rate increased to $23 \%$ on 01.01 .2012 and remains at this rate. An addlitional reduced rate of $9 \%$
    Italy: Standard rate increased to $21 \%$ on 17.09.2011. A further increase-to $22 \%$-took place on 01.10.2013. From 1.1 .2016 introduction of $5 \%$ reduced rate for medical, welfare and educational services given by social cooperatives.
    

    Latvia: Reduced rate decreased to $5 \%$ on 01.05.2004. Standard rate decreased to $21 \%$ on 01.07.2012. .
    Luxembourg: The second reduced rate in the table is actually a "parking rate .
    Hungary: The second reduced rate ( $15 \%$ ) was abolished on 01.09.2006. Reintroduced on 01.07 .2009 at $18 \%$ together with the increased of the standard rate to $25 \%$.
    Netherlands: Standard rate increased to $21 \%$ on 1.10 .2012 .
    Poland: The (super--reduced rate of $3 \%$ was introduced on 04.09.2000.
    Portugal: Standard rate increased to $19 \%$ on 05.06.2002. Standard rate further increased to $21 \%$ on 01.07.2005. Standard rate decreased to $20 \%$ on 01.07.2008. All rates increased by $1 \%$ on $01 / 07 / 2010$.
    Romania: The second reduced rate ( $5 \%$ ) introduced on 01.12.2008. Standard rate increased to $24 \%$ on 01.07.2010. Standard rate decreased to $20 \%$ on 01.01 .2016 . Standard rate decreased from $20 \%$ to $19 \%$ on 01.01 .2017 .
    Slovenia: Reduced rate increased to $9.5 \%$ and standard rate increased to $22 \%$ on 1.07 .2013 .
    Slovakia: The second reduced rate ( $6 \%$ ) introduced on 01.05.2010. Abolished on 01.01.2011 together with the standard rate increase to $20 \%$.
    United Kingdom: Standard rate increased to $20 \%$ on 04.01.2011

[^6]:    ${ }^{\left({ }^{( }\right)}$The ITR on labour is calculated as the ratio of taxes and social contributions on employed labour income to total compensation of employees and payroll taxes.
    $\left.{ }^{( }{ }^{7}\right)$ It should be noted that wage subsidies (including some reductions in social security contributions) are not taken into account.
    ${ }^{(8)}$ Austria, Belgium, Czech Republic, Denmark, France, Italy, Luxembourg, Slovakia and Spain. See the section below for more detail about the treatment of payable tax credits.

[^80]:    (1) European Commission (2013)

[^81]:    ${ }^{(2)}$ Sums by main economic function may however not add up due to: (a) the non-inclusion of taxes - other than own resources - paid to EU institutions in the case of Belgium and Portugal, and (b) the non-attribution of 'revenues assessed but unlikely to be collected' to economic function bases for those countries using D.995.

[^82]:    ${ }^{(3)}$ ) The methodology utilised by Member States to arrive at the PIT split is described in more detail in a separate section of this annex (see
    'Methods used to split the revenue from personal income tax' in Part F).

[^83]:    $\left.{ }^{4}\right)$ A possible breakdown of car registration taxes between those paid by companies and those paid by households would only be available for some countries. Hence, to avoid a different treatment in different Member States, all revenue from car registration taxes has been attributed to consumption.

[^84]:    ${ }^{(5)}$ See also Regulation (EU) No 691/2011 on European environmental economic accounts, which uses the same definition.

[^85]:    ${ }^{\left({ }^{6}\right)}$ Although the difference is likely to be small for excise and consumption taxes.

[^86]:    ${ }^{(8)}$ See also Clark (2002).

[^87]:    ${ }^{(1)}$ European Commission (2001a).

[^88]:    ${ }^{(2)}$ The legal reference for the definition, calculation and allocation of FISIM are Council Regulation (EC) No 448/98 of 16 February 1998 completing and amending Regulation (EC) No 2223/96 with respect to the allocation of Financial Intermediation Services Indirectly Measured (FISIM) within the European system of national and regional accounts (ESA) and Commission Regulation (EC) No 1889/2002 of 23 October 2002 on the implementation of Council Regulation (EC) No 448/98 completing and amending Regulation (EC) No 2223/96 with respect to the allocation of Financial Intermediation Services Indirectly Measured (FISIM) within the European System of national and regional Accounts (ESA).

[^89]:    ${ }^{(13)}$ Financial intermediaries provide services for which no explicit charge are made. The estimate of this latter is known in national accounts as the Financial Intermediation Services Indirectly Measured (FISIM) and it is fixed by convention. Up to now FISIM has been recorded as intermediate consumption of a notional industry, for want of relative observable variables. (See http://europa.eu.int/estatref/info/sdds/en/ na/na_changes2005.pdf for details).

[^90]:    ${ }^{(4)}$ ) The methodology is described in: European Commission (2004a).

[^91]:    ${ }^{(5)}$ ) The profits of foreign affiliates are recorded in the distribution of income as 'reinvested earnings on foreign direct investment' (D.43) between the parent and subsidiary company. The flow D. 43 paid in national accounts means that subsidiaries in the host country have retained profits and this is attributed to the parents abroad in national accounts. The flow D. 43 received consists of retained profits of subsidiaries abroad attributed to the parent companies in the investigated country. Both flows can have a negative sign in the case of losses of the subsidiaries. The solution for the ITR tax base is not taking reinvested earnings on foreign direct investments into account. On the one hand the profit (or loss) of a parent earned abroad is not counted. On the other hand the retained profits (or losses) of foreign subsidiaries in the home country is not deducted from the ITR tax base.
    ${ }^{(6)}$ The ITRs for the whole private sector avoid double counting of dividends that are distributed by domestic companies out of their operating profits by deducting dividends paid to domestic private households or other domestic companies from the capital ITR tax base. For more details on this issue see European Commission (2004a).

[^92]:    ${ }^{\left({ }^{7}\right)}$ A detailed classification of taxes to the different categories for each Member State is available on the webpage of the Directorate-General for Taxation and Customs Union.
    ${ }^{(8)}$ Note that as far as rent income is concerned, the definition adopted here departs from the customary tax treatment of property income, which in most cases is based on gross property income (possibly with some deduction of interest expenses).
    ${ }^{(19)}$ Strictly speaking, it is the balance of attributed property income (D.44) paid mainly to private households and received property income attributed to insurance policyholders because also corporations and quasi- corporations can be insurance policyholders too.

[^93]:    ${ }^{(20)}$ For the private sector as a whole, including or excluding D. 44 (received minus paid) from the tax base has no major empirical impact on the ITR on capital income since the net D. 44 is close to zero and represents nearly exclusively a flow from financial corporations to households.
    ${ }^{(21)}$ The capital gains are not recorded in the generation and distribution of income accounts. Some information can be found in the revaluation accounts. Up to now we have not tested whether these data could be used for our purposes.

[^94]:    (22) PIT revenues are also recorded in the government sector which receives the payments.

[^95]:    ${ }^{(23)}$ However, the tendency for the ITR to increase can be offset to some extent by the fact that interest is often more highly taxed than dividends in the hands of personal investors. Only countries with classical tax systems tax interest as much as dividends at the personal level. Others have some form of relief for double taxation of dividends. So there could be more personal income tax on interest than on dividends, offsetting some of the effect mentioned.

[^96]:    ${ }^{(24)}$ This approach has been introduced by Mendoza, Razin and Tesar (1994) and was used in internal studies by the Economics and Financial Affairs Departments of both the European Commission and the OECD. See Martinez-Mongay (2000) and Carey and Rabesona (2002) for more details.

[^97]:    ${ }^{(25)}$ See also OECD $(2000,2002)$, Clark (2002) and De Haan, Sturm and Volkerink (2002).
    ${ }^{(26)}$ This approach has been introduced by Mendoza, Razin and Tesar (1994) and was used in internal studies by Economics and Financial Affairs departments of both the European Commission and the OECD. See Martinez-Mongay (2000) and Carey and Rabesona (2002) for more details.
    ${ }^{(27)}$ ) See also OECD (2000, 2002b) and De Haan, Sturm and Volkerink (2002).

[^98]:    ${ }^{(28)}$ In order to illustrate the degree of precision that can be reached with using micro data rather than aggregate tax return data, the Ministries of Finance and Taxation in the Netherlands, Finland, Denmark and Italy performed additional calculations on the basis of only aggregate tax return data for some years. It appeared that the differences for the estimated amounts of income tax raised on income from employed labour were rather small. The reason is that employed labour income is by far the most dominant income source, which means that the overall effective income tax rate (measured on the aggregate taxable income and across all taxpayers) is strongly influenced by the average effective tax rate on labour income. The differences were however significant for the other selected income sources. If only aggregate tax return data were used, generally higher fractions would be computed for capital income and income in the form of social transfers and pensions, and generally lower fractions would be computed for income from selfemployed labour.

[^99]:    ${ }^{(29)}$ Except the income and taxes of 'continuous and coordinated collaborations' that are allocated to the labour category. The income of these self-employed workers is treated, for tax purposes, as income of employed workers.

[^104]:    ${ }^{(30)}$ European Commission (2001a)
    ${ }^{(31)}$ ) For the most recent report see ZEW (2015), Effective Tax Levels using the Devereux/Griffith Methodology, Mannheim.
    ${ }^{(32)}$ In the absence of personal taxes, the company is assumed to be required to earn a post-tax real rate of return of $5 \%$. The cost of capital is the implied required pre-tax real rate of return. The cost of capital is calculated for each of 15 different types of investment ( 5 assets, each possibly financed from 3 sources).
    $\left.{ }^{(33}\right)$ The EMTR is a straightforward calculation as the proportionate difference between the cost of capital and the post-tax real rate of return of $5 \%$. The EMTR is not represented in the tables, since, in the absence of personal taxes, it does not provide more information than the cost of capital.
    ${ }^{(34)}$ The effective average tax rate is in principle the relevant rate for analysing discrete investment choices, such as where to locate. The EATR is calculated for each of 15 different types of investment ( 5 assets, each possibly financed from 3 sources). However, now there is not only a post-tax real rate of return required by the shareholder, but also a fixed pre-tax rate real rate of $20 \%$, while the minimum required posttax real rate of return (in the absence of personal taxes) remains at $5 \%$. This generates an investment project with a positive net present value. The EATR is a measure of the present value of taxes paid expressed as a proportion of the net present value of the income stream (excluding the initial cost of the investment).
