INTRODUCTION

This 2017 report of the project TAXUD/2013/CC/120 presents estimates of the effective tax rates on investment in the EU member states, FYROM and Turkey as well as Norway, Switzerland, Canada, Japan and the United States. The work presented in this report updates for the year 2017 the analyses of the previous projects within the former Framework Contract TAXUD/2012/CC/120 and the current Framework Contract TAXUD/2013/CC/120. Following the methodology used in previous work, we apply the Devereux and Griffith framework to compute effective tax levels.

The report considers primarily taxes on corporations in each country, but also includes analyses of personal taxes on investment and saving. It also considers both cross-border investment and investment by small and medium sized enterprises (SME).

Background information to the applied model can be found in Devereux and Griffith (1999, 2003), Schreiber et al. (2002) and European Commission (2008, p. 3-54).¹ In addition, the European Commission has recently published studies on the specific impact of interest and inflation rates, tax planning and the debt/equity bias on forward-looking effective tax rates.²

This report is organized as follows.

Section A introduces the tax parameters for the period 1998 – 2017 covered by this report. These tax parameters form the basis of the computations of effective tax rates.

Section B provides worked examples for several countries for a better understanding of the model.

Section C then provides detailed results for domestic investment in all countries covered in this report. In addition to results focusing on the corporate level, this report comprehensively includes the analysis of personal taxes on investment and saving at the shareholder level for three different types of shareholders when calculating effective tax rates on domestic investment.

Section D presents estimates for effective tax burdens of cross-border investment if all countries were either locations of investment or locations of the investor.

Finally, Section E provides effective tax burdens of SMEs in selected countries.

Please note that all results presented in this report refer to the legal situation as of 1 July 2017.

¹ Devereux, M.P. and R. Griffith (1999), *The taxation of discrete investment choices*, Institute for Fiscal Studies Working Paper 98/16 (Revision 2), London; Devereux, M.P. and R. Griffith (2003), *Evaluating tax policy for location decisions*, *International Tax and Public Finance*, 10, 107-126; Schreiber, U., Spengel, C. and L. Lammersen (2002), *Measuring the Impact of Taxation on Investment and Financing Decisions*, *Schmalenbach Business Review*, 54, 2-23; European Commission (2008), *Effective Tax Levels Using the Devereux/Griffith Methodology*, Brussels.

² European Commission Taxation Paper Series:

Taxation Paper No 63 (2016): *The Effect of Inflation and Interest Rates on Forward-Looking Effective Tax Rates*.

Taxation Paper No 64 (2016): *The Impact of Tax Planning on Forward-Looking Effective Tax Rates*.

Taxation Paper No 65 (2016): *The Effects of Tax Reforms to Address the Debt-Equity Bias on the Cost of Capital and on Effective Tax Rates*.

Summary Table
Effective average tax rate by country, 2017
by asset, source of finance and overall
only corporation taxes

| Country | Corporate tax rates | Overall mean | EATR | | | | | | | |
|----------------|---------------------|--------------|----------------------|-------------|-----------|------------------|-------------|-------------------|------------|------|
| | | | Industrial buildings | Intangibles | Machinery | Financial assets | Inventories | Retained earnings | New Equity | Debt |
| Austria | 25.0 | 23.1 | 23.5 | 23.4 | 22.3 | 24.4 | 22.0 | 26.1 | 26.1 | 17.4 |
| Belgium | 34.0 | 29.3 | 33.3 | 23.0 | 27.8 | 32.9 | 29.6 | 33.3 | 33.3 | 21.9 |

(1) There is a notional interest deduction applicable since assessment year 2007 (income of 2006). The deduction is calculated as a percentage of the equity (incl. retained earnings), determined according to Belgian accounting law. The notional interest rate is based on the return on a 10-year state bond. The rates were for income years 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016 and 2017 respectively 3.442%, 3.781%, 4.307%, 4.472%, 3.80%, 3.425%, 3.00%, 2.742%, 2.63%, 1.63%, 1.131% and 0.237%.

(2) So-called defence contribution.

(3) Split-rate system since 2000: The corporate tax rate for retained profits is 0 %.

(4) French resident companies who distribute dividends are subject to an additional contribution of 3% on distributed profits. This regulation has been abolished for fiscal years starting from 2017.

(5) Split-rate system: For distributed profits, the corporation tax is reduced to 30%. Local tax is deductible from the base of corporation tax and its own tax base.

(6) Local tax is deductible from the tax base of corporation tax and its own tax base.

| | Nominal corporate income tax rate | Surcharge | Local profit tax rates (nominal) | Effective statutory profit tax rates |
|------|---|-----------|-------------------------------------|---|
| (7) | Lump sum profit tax at the amount of 10% on total net income exceeding 5 million €. | | | |
| (8) | An additional solidarity tax is levied on a taxable base similar to that of the corporate income tax. | | | |
| (9) | 125% of local tax are deductible from corporate tax in 2004. In 2005, 150% are deductible. From 2006 to 2009, 200% are deductible. Starting from 2010, only 100% are deductible. | | | |
| (10) | The general available tax rate for the manufacturing sector and certain financial services operations is 10%. The general tax rate was 32% in 1998, 28% in 1999-2000, 20% in 2001, and 16% in 2002. From 2003 on, only certain manufacturing and international financial services operations are taxable at the 10% rate. | | | |
| (11) | In 2009, Latvia introduced a notional-interest deduction. A company may, in respect of taxable periods beginning after 31 December 2008, claim a deduction in each taxable period equal to the aggregate of all its retained profits for any taxable period beginning after 31 December 2008 multiplied by the annual weighted average interest rate on loans denominated in Latvian currency and extended to non-financial enterprises in that year. Given that the retained earnings of 2009 are taxed preferentially in 2010, the first tax consequences of the notional-interest deduction show up in 2010. The applicable interest rate as published by the Bank of Latvia is 5.05% in 2010, 4.37% in 2011, 3.9% in 2012 and 4.48% in 2013. The notional-interest deduction was abolished in 2014. | | | |
| (12) | An additional tax is levied on the corporate income tax base. | | | |
| (13) | The municipality surcharge of 10% applies to the tax due which is equivalent to multiplying the corporate tax rate with 1.1. | | | |
| (14) | The municipality surcharge (derrama) of 1.5% and the state surcharge (derrama estadual) of 2.5%/5%/7% apply to the taxable profit and are, therefore, added to the corporate tax rate. | | | |
| (15) | The local business tax (impuesta sobre actividades) is deductible from the corporate income tax base. | | | |
| (16) | The effective tax rate is reduced to around 26.37% in 1998-2000 if contributions to the profit periodisation reserve (periodiseringsfond) of up to 20% are taken into account. In 2001-2010 the maximum reserve is up to 25%. As from financial year 2005 a standardized income is imposed on former years appropriation with 72% of the interest rate on Governmental debt notes (7.1%). In the calculations, the interest rate on Governmental debt notes is not adjusted but kept constant over time in order to ensure that only tax policy changes affect the effective tax rate (instead of financial market events). The effective tax rate is thus 25.64% in 2001-2004, 27.34% in 2005-2008, 25.68% in 2009-2012 and 21.48% from 2013 to 2015. | | | |
| (17) | Province of Ontario. | | | |
| (18) | Rate for companies engaged in manufacturing and processing activities. General rate in Ontario is 14% from 2005 to 2009, 13% in 2010, 11.75% in 2011 and 11.5% from 2012 to 2017. | | | |
| (19) | The Californian corporate income tax is considered. | | | |
| (20) | In 2005 and 2006, a deduction of 3% applies to profit generated from manufacturing activities thus reducing the effective tax rate for qualified production activities income: $(1-0.03) \times [0.35 + 0.0884 \times (1-0.35 \times (1-0.03))]$ = 0.3979. Starting from 2007 the deduction is 6%. In 2010, the deduction rate was increased to 9%. | | | |
| (21) | 10% of the Italian IRAP are deductible from the corporate income tax base. | | | |
| (22) | The corporate income tax rate in Japan has been reduced to 25.5% for fiscal years beginning from April 2012. A special surcharge of 10% was levied from 1 April 2012 to 31 March 2014 for the reconstruction after the Great East Japan Earthquake. The corporate income tax rate amounted to 28.05% (=25.5%*110%). In 2015 (2016), the corporate income tax rate has been reduced to 23.9% (23.4%). A local surcharge of 4.4% has been implemented in 2014. The corporate income tax rate amounts to 24.95% (=23.9%*104.4%) (24.4% =23.4%*104.4%). | | | |
| (23) | Italy has reintroduced a notional interest deduction in 2011. The return on equity is deductible at a rate of 3% in 2012-2013, at a rate of 4% in 2014, 4.5% in 2015, 4.75% in 2016 and 1.6% in 2017. | | | |
| (24) | There was a notional interest deduction applicable in Croatia for the years 1994-2000. The notional rate was 5% plus a mark-up for inflation. For this mark-up we assume the model inflation rate of 2%. | | | |
| (25) | On 9 July 2015, Cyprus passed a new law introducing a notional interest deduction regime, effective as of January 2015. The deduction is calculated by multiplying the new equity issued and used in the business by the highest of either the yield of the 10-year government bond of the state in which the new equity is invested plus 3%, or the yield of the 10-year Cyprus government bond plus 3%, on 31 December of the tax year preceding the relevant tax year. The yield of the 10-year Cyprus government bond plus a 3% premium is 8.037% in 2015, 6.685% in 2016, and 6.489% in 2017. | | | |
| (26) | The split rate system with a 0% tax rate for retained earnings has been abolished in 2015 with retroactive application also for the year 2014. However, the tax base can be decreased by the amount of profits reinvested in tangible and intangible assets which are owned by the taxpayer for at least 5 years. Therefore, we continue to apply a 0% tax rate to retained earnings for all assets except for the financial asset. | | | |

Table A-2
Alternative nominal statutory corporation tax rates (%)
1998-2017

| | Year | Tax rate | Case | |
|-----------|-----------|-----------|--|----------------|
| Austria | 2001-2004 | 25 | Assets, financing with new equity or retained earnings | |

| | | 2008 | 29.50 | Foreign Income |
| 2009 | | 29 | Foreign Income | |
| 2010 | | 28 | Foreign Income | |
| 2011 | | 26.5 | Foreign Income | |
| 2012-2017 | | 25 | Foreign Income | |

Remarks:

Cyprus: Passive interest income is subject to a defence contribution at the rate specified in the table.

France: Interest income is subject to the standard corporate income tax rate plus surcharge. It is not included in the tax base of the regional CVAE (“Contribution sur la Valeur Ajoutée des Entreprises”) introduced in 2010.

Italy: From 1998 to 2001 under the dual income tax system (DIT), a reduced corporate income tax rate of 19% applies to that part of the profits equal to the return of qualifying new equity investments. Beside financial assets, all kinds of investment qualify for the DIT. The qualifying equity is a multiple of new equity since 1997. The multiplier is 1.0 in 1998-1999, 1.2 in 2000, and 1.4 in 2001. The interest rate applicable for calculating the qualifying return is 7% in 1998-2000 and 6% in 2001. Since 2002, interest income is taxed with the normal corporate tax rate and is not included in the tax base of the regional tax (IRAP).

(1) The nominal tax rate already accounts for possible valuation effects.

(2) The effective rate accounts for the deductibility of real estate tax (τ_{re}) from corporate income tax (τ_{cor}). It is determined by $\tau_{re} * (1 - \tau_{cor})$. E.g. in Austria, the effective rate amounts to $0.25\% * (1 - 25\%) = 0.19\%$.

(3) Deduction is only allowed from the IRAP tax base, not from the corporate income tax base.

(4) Net wealth tax is credited against liability of corporation tax.

(5) At the condition that the company allocates part of its profits to a specific reserve which is maintained for five years, the net worth tax in each year is reduced by one fifth of the reserve formed. The reduction may not exceed the corporate income tax in that year including surcharges. Hence the effective tax burden from net wealth tax can be reduced to zero.

(6) The net wealth tax was abolished in July 2010 in Ontario.

(7) Ireland: The nominal real estate tax rate is obtained by multiplying the basic tax rate (0.79% from 2008) with a local multiplier set by the Dublin City Council (0.258 for 2017).

Remarks:

Investments in industrial buildings trigger liability to real estate tax in most countries. The tax base of real estate tax often is the book value or market value of the industrial building. In several countries however, the tax base is a value determined by the tax offices which is not directly connected to the book value of the building but to the building's location. Some of these values relate to the location's market values in the past (e.g. in Germany) and do not have any link to recent market values. In these cases, we had to make assumptions concerning the country-specific relation between the acquisition cost we use in the model and the tax value determined by the tax offices. These assumptions are confirmed by experts from PwC and are – for the EU15 – in line with European Commission (2001).

Austria: We assume that the tax base amounts to 25% of the acquisition costs (= market value). Considering a tax coefficient of 0.2% and an average tax rate of 500% results in a nominal real estate tax of 0.25% ($25\% * 0.2\% * 500\%$).

Belgium: The tax is levied on the rental income of buildings fixed by local tax authorities. Since 2009, it is assumed to be 5.3% of acquisition costs. The rate of Brussels is 1.25% plus a local multiplier of 3189% of 1.25% in 2009, and 2950% of 1.25% from 2010 onwards. Therefore, the nominal tax rate is $5\% * (1.25\% + 3189\% * 1.25\%) = 2.0556$ in 2009 and 2.0206 since 2010.

Bulgaria: The tax base is the book value of the building. It is assumed that the book value corresponds to the acquisition costs. The average tax rate is 0.15%. Thus, the nominal real estate tax is 0.15% for 1998-2007. Starting from 2008 municipal councils have been allowed to determine tax rates within a certain range. For the purpose of this study the average (nominal) real estate tax rate is assumed to be the average of the defined minimum and maximum values. In 2017 these values are 0.01% and 0.45% respectively.

Cyprus: The real estate tax rate ranged between 0% and 1.9% in 2013-2016. In this study, the highest tax rate 1.9% is used. The assessed value is 50% of the market value.

Czech Republic: The tax base is derived from the area of a building in square metres. An average value per square metre is assumed, e.g. a tax on the capital invested in the building is computed indirectly.

Denmark: There are three types of taxes: municipal tax, country tax, and a special municipal tax on buildings used for business purposes. The aggregated tax rate for Copenhagen is 1%. The tax base is the market value of the building.

Finland: It is assumed that the tax base corresponds to the market value (and, further, that the market value corresponds to the acquisition costs of one unit). As the average tax rate we take the mean of the minimum and the maximum tax rate.

France: The rental value of the building is assumed to amount to 8% of the acquisition. For the rental value of built real estate properties, a rebate of 50% is granted. Therefore, the relevant rental value amounts to 4%. The average tax rate is 34.83% in 1998-2001, 35.88% in 2002, 36.96% in 2003, 37.58% in 2004, 38.94% in 2005-2006, 31.05% in 2007, 31.37% in 2008, 32.82% in 2009, 32.41% in 2010, 32.48% in 2011, 32.7% in 2012, 35.3% in 2013-2014, 35.5% in 2015 and 36% in 2016. The nominal real estate tax thus is 1.39% in 1998-2001, 1.44% in 2002, 1.48% in 2003, 1.5% in 2004, 1.56% in 2005-2006, 1.24% in 2007 and 1.25% in 2008, 1.31% in 2009, 1.29% in 2010 and 1.28%/1.3% in 2011, 1.40% in 2012 to 2014, 1.42% in 2015 and 1.48% in 2016 and 2017.

Germany: We assumed that the tax base amounts to 25% of the acquisitions costs (= market value). Considering a tax rate of 0.35% and an average tax coefficient of 442% in 1998-2007, 469% in 2008-2009 and 467% in 2010-2017 results in a nominal real estate tax of 0.39% in 1998-2007 resp. 0.41% in 2008-2017 and an effective tax rate of 0.23% in 2001-2007 and 0.28% in 2008-2017.

Greece: The nominal real estate tax is the sum of the state tax rate and the local tax rate in Athens.

Hungary: The real estate tax rate is 1,900 HUF per m² of the industrial building. Assuming an average value of 190,000 HUF per m² the nominal rate per unit thus is 1%.

Ireland: The annual rent of the building is assumed to amount to 5% of the acquisition costs. The rental value is discounted back to the level of 1988, which is about 25% of the market value. The valuation is 63% (the valuation coefficient for real estate located in Dublin) of rental value. The average rate is 37.18 in 1998, 38.80 in 1999, 40.54 in 2000, 43.99 in 2001, 46.86 in 2002, 49.90 in 2003, 52.59 in 2004, 55.21 in 2005, 57.41 in 2006, 59.52 in 2007, 61.87 in 2008, 63.91 in 2009, 62.63 in 2010, 62.25 in 2011, 61.19 in 2012, 60.88 in 2013, 25.70 in 2014, 25.60 in 2015 and 2016, and 25.80 in 2017.

Italy: The tax value is assumed to amount to 50% of acquisition costs (as the acquisition costs amount to one unit, the tax value is 50%). The average tax rate is assumed to be 0.55% (which is the average of the minimum of 0.4% and the maximum of 0.7%). Therefore, the nominal real estate tax is 0.275%. Up to 2007, the real estate tax was deductible from the IRAP tax base but not from the corporate income tax base. Since 2008 it is neither deductible from the IRAP nor the corporate income tax base. In 2012 the existing real estate tax was replaced by the new municipal tax IMU. The standard rate is 0.76%. In 2012 the taxable value is increased to 63%. Therefore the nominal rate is 0.48%. In 2016 the taxable value is increased to 68%. Therefore the nominal rate is 0.52%. In 2017 main Italian regions make use of the option of an upward adjustment of the local multiplier. This leads to a nominal rate of 0.72%. The tax is neither deductible from the IRAP nor the corporate income tax base.

Latvia: The tax of 1.5%/1% is levied on the rental income of land which is determined by local tax authorities. Buildings are taxed separately on the annual average book value.

Lithuania: The tax of 3% is levied on the taxable value of immovable property. It is assumed that the assessed value is 50% of the acquisition cost.

Luxembourg: It is assumed that the tax base amounts to 10% of acquisition costs (= market value). Considering a tax coefficient of 1% and a tax rate of 750% (Luxembourg City) results in a nominal real estate tax of 0.75%.

Netherlands: It is assumed that the tax base amounts to 100% of the acquisition costs (= market value).

Poland: The tax base is the area of a building in square metres. An average value per square metre is assumed, e.g. a tax on the capital invested in buildings is computed indirectly.

Portugal: The taxable value is determined by reference to the officially appraised notional rent in 1998-2002. It is assumed that the tax base amounts to 50% of the acquisition costs. The average tax rate is assumed to be 1% (which is the average of the minimum of 0.7% and the maximum of 1.3%). Therefore the nominal real estate tax is 0.5% in these years. From 2003 on, there is a new tax base. The taxable value of urban property is determined by reference to certain coefficients (e.g. average construction price, area and type of construction, age), which aim to fix the taxable value at 80% to 90% of the market value. It thus is assumed that the tax base is 85% of acquisition costs. The average tax rate is assumed to be 0.375% (which is the average of the minimum of 0.3% and the maximum of 0.45%).

Romania: The tax base corresponds to the market value. For 2007-2015 we assume an average tax rate of 0.875% (which is the mean of the minimum tax rate 0.25% and the maximum tax rate 1.5%). Thus the nominal real estate tax in 2007-2015 is 0.875%. As of 2016 the maximum tax rate decreased to 1.3% leaving the assumed nominal tax rate at 0.75%.

Slovakia: The tax base is the area of a building in square metres. We assume an average value per square metre, e.g. a tax on the capital invested in buildings is computed indirectly. Due to a reform in the calculation of the tax base the nominal real estate tax increases by about four times the former tax due from 2005 on.

Spain: The tax value is assumed to amount to 50% of the acquisition costs (as the acquisition costs amount to one unit, the tax value is 50%). The average tax rate is assumed to 0.8% (which is the mean of the minimum of 0.4% and the maximum of 1.2%). Therefore the nominal real estate tax is 0.4%. A surcharge of 10% is applied in 2012 and the following years replacing a reevaluation of cadastral values which has not been conducted for years.

Sweden: It is assumed that the tax base amounts to 75% of the acquisition costs (= market value). The tax rate of 0.5% for industrial property results in a nominal real estate tax of 0.38% (= 75% * 0.5%).

United Kingdom: The contractual basis is assumed to apply. For this purpose, the net annual value is based on the annual rent of the building which is assumed to amount to 5% of the acquisition costs (as acquisition costs amount to one unit, the annual rent is 5%). The rate in the pound is 47.4 in 1998, 48.9 in 1999, 41.6 in 2000-2001, 43.7 in 2002, 44.4 in 2003, 45.6 in 2004, 42.2 in 2005-2006, 44.4 in 2007, 46.2 in 2008, 48.1 in 2009, 41.4 in 2010, 43.3 in 2011, 45.8 in 2012, 47.1 in 2013, 48.2 in 2014, 49.3 in 2015, 49.7 in 2016 and 47.9 in 2017.

FYROM: The tax base corresponds to the market value. The municipal councils levy a tax rate ranging from 0.1% to 0.2%. Since most municipalities apply a rate of 0.1%, this rate is also assumed for the calculations in this study.

Norway: The taxable value of the industrial building is assumed to be 35% of the acquisition costs. The average tax rate is assumed to be 0.45% (which is the mean of the minimum tax rate 0.2% and the maximum tax rate 0.7%) in 2007, 0.59% from 2008 to 2009, 0.58% in 2010-2011, 0.59% in 2012-2013, 0.58% in 2014, 0.57% in 2015, 0.58% in 2016 and 0.57% in 2017. Thus the nominal real estate tax rate is 0.16% in 2007, 0.21% in 2008 and 2009, 0.20% in 2010-2011, 0.21% in 2012-2013 and 0.20% in 2014-2017.

Turkey: It is assumed that the assessment value corresponds to the market value. The average tax rate is generally 0.2%.

Canada: The tax base corresponds to the market value. The city tax rate for Toronto is 2.57% in 2005, 2.32% in 2006, 2.31% in 2007, 2.29% in 2008, 2.15% in 2009, 2.00% in 2010, 1.82% in 2011, 1.74% in 2012, 1.67% in 2013, 1.60% in 2014 and 1.53% in 2015. There is an additional tax (education tax) which is levied at rates of 2.31% in 2005, 2.06% in 2006, 2.05% in 2008, 1.86% in 2009, 1.70% in 2010 and 1.57%, 2011, 1.54% in 2012, 1.39% in 2013, 1.34% in 2014 and 1.29% in 2015. This results in nominal real estate taxes of 4.89% in 2005, 4.38% in 2006, 4.37% in 2007, 4.34% in 2008, 4.01% in 2009, 3.70% in 2010, 3.39% in 2011, 3.19% in 2012, 3.06% in 2013, 2.94% in 2014, 2.77% in 2015 and 2.64% in 2016.

Japan: The tax base corresponds to the market value. The tax rate amounts to 0.3%.

United States: A net wealth tax is imposed on tangible assets, i.e. on industrial buildings and machinery. The tax rate may not exceed 1% and is levied by the municipality. The tax base is the market value.

Table A-4
Non-profit taxes on assets other than real estate tax and net wealth tax (%)
1998-2017

| | | Nominal tax rate | Effective tax rate | Assets | Nominal tax rate | Effective tax rate | Assets |
|--------|------|------------------|--------------------|-----------|------------------|--------------------|-----------|

| | 2008 | 3.649 | 2.393 | Machinery | 1.824 | 1.196 | Buildings |
| | 2009 | 3.664 | 2.402 | Machinery | 1.832 | 1.201 | Buildings |
| | 2010 | - | - | - | 1.832 | 1.201 | Buildings |
| | 2011 | - | - | - | 1.708 | 1.120 | Buildings |
| | 2012 | - | - | - | 1.708 | 1.091 | Buildings |
| | 2013 | - | - | - | 2.300 | 1.471 | Buildings |
| | 2014 | - | - | - | 2.300 | 1.427 | Buildings |
| | 2015 | - | - | - | 2.308 | 1.431 | Buildings |
| 2016 | - | - | - | 2.341 | 1.451 | Buildings | |
| 2017 | - | - | - | 2.341 | 1.535 | Buildings | |

Remarks:

The French tax professionnelle which was levied until 2009 is a kind of property tax which is levied on tangible fixed assets (i.e. machinery) and on buildings. The tax base for buildings is twice the tax base of real estate tax; the tax base for machinery equals acquisition costs. As for machinery, 16% of the tax base with a general deduction of 16% are multiplied with the statutory rate. The average rate is 26.91% in 2007 and thus the nominal tax rate for machinery is $0.16 \times (1 - 0.16) \times 0.2691 = 3.617\%$. The effective tax rate considers deductibility from the corporation tax base, i.e. in this example $3.617\% \times (1 - 0.3443)$. The average rate for 2008 is 27.15% and for 2009 it is 27.26%. The tax professionnelle was abolished in 2010. Instead, the so-called “Contribution Economique Territoriale” (CET) was introduced, consisting of CFE (“Contribution Foncière des Entreprises”) and CVAE (“Contribution sur la Valeur Ajoutée des Entreprises”). The CFE constitutes a tax on company’s immovable assets and the CVAE constitutes a tax on the added value if turnover exceeds EUR 152,500. The rates of CFE vary between municipalities. For 2010, the national average was 25.22%. For 2011 and 2012 the national average was 25.42%, for 2013 and 2014 it was 25.69%, for 2015 it was 25,76% and for 2016 and 2017 the national average was 26.13%. The tax base of the CFE is the notional rental value of the company’s immovable assets as determined by tax authorities. The rental value is calculated based on the regulations for real estate tax.

⁽¹⁾ In Estonia, only distributed profits are taxable. Thus, valuation of assets for tax purposes is irrelevant.

⁽²⁾ In Sweden, inventory may be valued at 97% of the total acquisition value.

Remarks:

Valuation of inventories represents the most tax-efficient possibility; other possibilities are ignored.

⁽¹⁾ In Estonia, only distributed profits are taxable. Thus, valuation of assets for tax purposes is irrelevant.

⁽²⁾ In Canada, only half of the annual depreciation is considered in the first year (half-year rule).

DB: Declining- balance

SL: Straight line

ufd: Until fully depreciated

Remarks:

Kind of allowance represents the most tax-efficient possibility; other possibilities are ignored.

Croatia: The useful life of industrial buildings defined in the law is 20 years leading to an allowance rate of 5%. Accelerated depreciation, however, is allowed, in that the allowance rate is doubled.

Czech Republic: Depreciation does not follow the typical methods of declining balance or straight line method. The depreciation of one year is determined by the useful life of the asset and the remaining years of depreciation. In the first year in the case of industrial buildings with a useful life of 30 years (45 years for 1998), depreciation is 3.3% (100/30). The following years, the residual value is multiplied by two and divided by the remaining years of depreciation plus one year. I.e. for the second year: $(100\% - 3.3\%) \times 2 / (30 - 1 + 1) = 6.4\%$.

FYROM: According to amendments of the Corporate Income Tax (CIT) Law, which entered into force as of 16 April 2011, companies can apply any depreciation method that is allowed under the applicable accounting standard. There are no restrictions with regard to tax regulation.

Slovakia: For the years 1998-2014, depreciation did not follow the typical methods of declining balance or straight line method. The depreciation of one year was determined by the useful life of the asset and the remaining years of depreciation. In the first year in the case of industrial buildings with a useful life of 20 years (30 years for 2003; 40 years for 1998 to 2002), depreciation was

5% (100/20). The following years, the residual value was multiplied by two and divided by the remaining years of depreciation plus one year, i.e. for the second year: $(100\%-5\%) \times 2 / (20-1+1) = 9.5\%$.

Spain. For tax years 2013 and 2014, the actual tax deductibility of depreciation is limited to 70% of the amount that would have been deductible according to the general rules. The non-deductible depreciation of 2013 and 2014 can be deducted on a straight-line basis over a period of 10 years starting in 2015.

| Kind of allowance | Allowance rate | Length of period (years) |
|--|----------------|--------------------------|
| ⁽¹⁾ Special depreciation investment incentives scheme implemented as of 31 May 2012 to 31 December 2013 – operating equipment acquired during the period may be capitalized and depreciated at a value of 115%. | | |
| ⁽²⁾ In Estonia, only distributed profits are taxable. Thus, valuation of assets for tax purposes is irrelevant. | | |
| ⁽³⁾ Only half of the annual depreciation is considered in the first year (half-year rule). | | |
| DB: Declining- balance; SL: Straight line; ufd: Until fully depreciated | | |

Remarks:

Kind of allowance represents the most tax-efficient possibility; other possibilities are ignored.

If the depreciation period depends on the useful life of the asset, we assume a period of 7 years for the calculation of the allowance rate.

Croatia: The useful life of machinery defined in the law is 4 years leading to an allowance rate of 25%. Accelerated depreciation, however, is allowed, in that the allowance rate is doubled.

Czech Republic: Depreciation does not follow the typical methods of declining balance or straight-line method. The depreciation of one year is determined by the useful life of the asset and the remaining years of depreciation. In the first year in case of machinery with a useful life of five years and an additional depreciation of 10% in the first year, depreciation is 30% $((100/5)+10)$. In the following years, the residual value is multiplied by two and divided by the remaining years of depreciation plus one year. I. e. for the second year: $(100\% - 30\%) \times 2 / (5-1+1) = 28\%$.

FYROM: According to amendments of the Corporate Income Tax (CIT) Law, which entered into force as of 16 April 2011, companies can apply any depreciation method that is allowed under the applicable accounting standard. There are no restrictions with regard to tax regulation.

Luxembourg: Since 2007, there is also additional allowance available in the first year of depreciation. In 2015 the rate of additional allowance is 6.84%.

Netherlands: To stimulate the economy in the economic downturn, in 2009 the Netherlands introduced an accelerated depreciation for qualifying investments in new machinery that may be depreciated in two years (50%). This scheme ended in 2011.

Norway: With effect from tax year 2014, in addition to the regular depreciation, accelerated depreciation (of up to 10% of the acquisition price) may be taken for machinery in the year of acquisition. This leads to an overall depreciation rate of 30% in year 1 and a depreciation rate of 20% in year 2 and the following years. The accelerated depreciation has been abolished at the end of the tax year 2016.

Slovakia: Depreciation does not follow the typical methods of declining balance or straight-line method. The depreciation of one year is determined by the useful life of the asset and the remaining years of depreciation. In the first year in case of machinery with a useful life of six years (eight years for 1998 to 2002), depreciation is 16.7% $(100/6)$. In the following years, the residual value is multiplied by two and divided by the remaining years of depreciation plus one year, i. e. for the second year: $(100\% - 16.7\%) \times 2 / (6-1+1) = 27.8\%$.

Spain: For tax years 2013 and 2014, the actual tax deductibility of depreciation is limited to 70% of the amount that would have been deductible according to the general rules. The non-deductible depreciation of 2013 and 2014 can be deducted on a straight-line basis over a period of the remaining useful life of the asset starting in 2015. Therefore, the deductible depreciation in the first year is $70\% \times 28.57\% = 20\%$. The non-deducted depreciation of 8.57% can be depreciated starting 2015.

⁽¹⁾ In Estonia, only distributed profits are taxable. Thus, valuation of assets for tax purposes is irrelevant.

⁽²⁾ In Canada, only half of the annual depreciation is considered in the first year (half-year rule).

DB: Declining- balance; SL: Straight line; ufd: Until fully depreciated

Remarks:

Kind of allowance represents the most tax-efficient possibility; other possibilities are ignored. If the depreciation period depends on the useful life of an intangible asset and no period is specific in the national tax codes, a period of 10 years was assumed for the calculation of the allowance rate.

Belgium: In addition, a first year allowance of 13.5% applies in 2017. In the years 2001 and 2006, the first year allowance amounted to 14.5%. In 2009 and 2010, it amounted to 15.5%, in 2011 it was 13.5%, in 2012 it was 15.5%. In 2013 it amounted to 14.5% and since 2014 to 13.5%.

Croatia: The useful life of intangibles defined in the law is 4 years leading to an allowance rate of 25%. Accelerated depreciation, however, is allowed, in that the allowance rate is doubled.

Czech Republic: For the years 1998 to 2003, depreciation did follow the typical methods of declining balance or straight-line method. The depreciation of one year was determined by the useful life of the asset and the remaining years of depreciation. In the first year in case of a patent with a useful life of 12 years (15 years for 1998), depreciation was 8.3% ($100/12$). In the following years, the residual value was multiplied by two and divided by the remaining years of depreciation plus one year. I. e. for the second year: $(100\% - 8.3\%) \times 2 / (12-1+1) = 15.3\%$.

Slovakia: For the years 1998 to 1999, depreciation did not follow the typical methods of declining balance or straight-line method. The depreciation of one year was determined by the useful life of the asset and the remaining years of depreciation. In the first year in case of a patent with a useful life of 15 years, depreciation is 6.7% ($100/15$). In the following years, the residual value is multiplied by two and divided by the remaining years of depreciation plus one year, i. e. for the second year: $(100\% - 6.7\%) \times 2 / (15-1+1) = 12.4\%$.

Spain: For tax years 2013 and 2014, the actual tax deductibility of depreciation is limited to 70% of the amount that would have been deductible according to the general rules. The non-deductible depreciation of 2013 and 2014 can be deducted on a straight-line basis over a period of the remaining useful life of the asset starting in 2015. Therefore, the deductible depreciation in the first year is $70\% \times 25.0\% = 17.5\%$. The non-deducted depreciation of 7.5% can be depreciated starting 2015.

FYROM: According to amendments of the Corporate Income Tax (CIT) Law, which entered into force as of 16 April 2011, companies can apply any depreciation method that is allowed under the applicable accounting standard. There are no restrictions with regard to tax regulation.

⁽¹⁾ In principle, no deduction of interest. Full deductibility in case of a foreign subsidiary which does not distribute profits (so-called ballooning in case of profit retention). The latter case is not considered in the determination of effective tax levels.

⁽²⁾ Cross-border dividends from a subsidiary allocated in an EU member state or Switzerland are tax-exempt. Other dividends are taxable, foreign taxes are credited against domestic corporate income tax.

⁽³⁾ Cross-border dividends from a subsidiary allocated in an EU/EEA member state are tax-exempt. Other dividends are taxable, foreign taxes are credited against domestic corporate income tax.

⁽⁴⁾ Cross-border dividends from a subsidiary allocated in an EU/EEA member state or Switzerland are tax-exempt. Other dividends are taxable, foreign taxes are credited against domestic corporate income tax.

⁽⁵⁾ Cross-border dividends from a subsidiary allocated in an EU member state or Switzerland are tax-exempt. Other dividends are taxable, foreign taxes are credited against domestic corporate income tax.

⁽⁶⁾ Interest expenses relating to dividend income received from the EU which is exempt are not deductible. Interest expenses relating to dividend income received from other countries are deductible as the corresponding income is subject to tax in Greece.

⁽⁷⁾ 99% Exemption applies to EU and EEA Member States and 95% for others.

| Dividends | | | Interest | | | Capital gains upon disposal of shares | | |
|--|---|---|----------|---|---|---------------------------------------|---|---|
| A | B | C | A | B | C | A | B | C |
| A: zero-rate shareholder. | | | | | | | | |
| B: top-rate shareholder with no qualified (substantial) participation. | | | | | | | | |
| C: top-rate shareholder with qualified (substantial) participation depending on the national tax provisions. | | | | | | | | |
| ⁽¹⁾ Since 2007, capital gains are only taxable if a substantial participation is sold to a legal entity outside the EEA. | | | | | | | | |
| ⁽²⁾ An imputation credit is granted. | | | | | | | | |
| ^(2a) Special lump sum contribution in the amount of 1% on income exceeding 100,000 €. | | | | | | | | |
| ^(2b) The stated tax rate is the sum of the statutory tax rate and the maximum special solidarity contribution of 4% for 2011-2014 on income exceeding 12,000 €. In 2015, the maximum special solidarity contribution is increased to 8% on income exceeding 500,000 €. In 2016, the maximum special solidarity contribution is increased to 10% on income exceeding 220,000 €. | | | | | | | | |
| ⁽³⁾ Tax rate on eligible dividends. | | | | | | | | |
| ⁽⁴⁾ Since March 2012, dividends are taxable at a rate of 12%, increased by a surtax ranging between 0%-18%. We assume a surtax of 18% as applicable for capital Zagreb. This yields a total rate of 12%*1.18=14.16%. | | | | | | | | |
| ⁽⁵⁾ As of 1 January 2013, interest income from fixed-term deposit accounts in commercial banks and branches of banks is taxable for individuals. The final tax due on that income is 8% on the gross interest received and should be withheld and paid by the respective bank in Bulgaria by the end of the month, following the month in which the income is acquired. | | | | | | | | |
| ⁽⁶⁾ Finland: From 2007 onwards we assume that the zero-rate shareholder receives dividends from a non-listed firm that do not exceed 90,000€ (150,000€ from 2014 onwards) and are less than 9% (8% from 2014 onwards) of the mathematical value of the company shares. Then, until 2013, dividend payments are exempt. From 2014 onwards, 75% of dividend payments are tax exempt and 25% are taxed as capital income at 30% (for income below 50,000€). | | | | | | | | |
| ⁽⁷⁾ Finland: From 2007 onwards we assume that the qualified and non-qualified top-rate shareholder receives dividends from a non-listed firm that exceed 90,000€ (150,000€ from 2014 onwards) by a significant amount but are less than 9% (8% from 2014 onwards) of the mathematical value of the company shares. In this case dividends exceeding 90,000€ (150,000€ from 2014 onwards) are taxed as if they were received from a quoted company (15% or 30% are tax exempt from 2014 onwards or up to 2013, respectively, the remaining sum is taxed as capital income at the tax rate for income above 50,000€, 32%). Note that, if we assume very large dividend payments, the marginal rate for dividends from a non-quoted and a quoted company are equivalent. | | | | | | | | |
| ⁽⁸⁾ Slovakia: Starting from 1 January 2016, income from capital (excluding capital gains) is not included in the aggregate income but is considered as a separate category of income subject to tax at the rate of 19%. The taxable base is calculated separately. | | | | | | | | |
| ⁽⁹⁾ FYROM: Capital gains from the sale of securities and equity participations in companies are subject to income tax on 70% of the gain. Starting from 1 January 2013 such capital gains are exempt from taxation until 31 December 2018. | | | | | | | | |
| ⁽¹⁰⁾ Slovakia: Dividends paid from the profit reported after 1 January 2017 are subject to a tax rate of 7%, or 35% if the individual is a resident of a non-contracting state. A 7% withholding tax rate is also applied if the dividend is paid by a Slovak company. | | | | | | | | |

Table A-11
Top marginal tax rates of individual net wealth tax on shareholdings and lending (%)

| Japan | 2005-2017 | - | - | - |
| USA | 2005-2017 | - | - | - |

Remarks:

France: Since 1999 Substantial shareholding (>25%) is exempt from net wealth tax.

Luxembourg: Shareholders are subject to a net worth tax of 0.5%, which is not levied anymore since 2006.

Norway: We assume a rate of 0.3% in 2007-2014 and a rate of 0.15% in 2015-2016 for federal net wealth tax and a rate of 0.7% for municipal net wealth tax. Shares are valued to 65% in 2005, to 80% in 2006, to 85% in 2007, to 100% in 2008-2016 and to 90% in 2017.

Netherlands: Net Wealth Tax was abolished in 2001 but special Interest-Box taxation is modelled via net wealth tax.

Finland: Tax rates differ for dividends distributed by quoted and non-quoted companies. Here, it is assumed that the shareholder receives dividends from a non-quoted company, since shareholder taxation should be of greater importance to non-quoted companies than to large quoted companies.

Section B

Worked Examples

SECTION B: WORKED EXAMPLES

The first two subsections present two simple worked examples of how we derived the measures of the cost of capital, the EMTR and the EATR from the raw tax data. The examples correspond to a domestic investment in the UK and in France on both company-level and the shareholder-level in 2005. Thereafter, we present calculations in the case of a cross border investment. The following subsections refer to specific taxes or characteristics of taxes in Spain, Hungary, Sweden, Estonia, Belgium, Italy, Turkey, Cyprus and Portugal and describe the implementation of these taxes into the methodological approach. Furthermore, calculations of specifics such as partnerships or specific allowances in the case of Germany's SMEs are discussed.

B.1 United Kingdom: Worked Example for Domestic Investment

Table B-1 summarises the economic parameters assumed in the base case. Table B-2 presents the essential elements of the British tax code.

Table B-1
Economic Parameters

| | | |
|-------------------------------------|----------|-------|
| True economic depreciation rate (%) | δ | |
| - intangibles | | 15.35 |
| - industrial buildings | | 3.1 |
| - machinery | | 17.5 |
| real interest rate (%) | r | 5 |
| inflation rate (%) | π | 2 |
| pre-tax rate of return for EATR (%) | p | 20 |

Table B-2
Domestic Tax Parameters

| | | |
|------------------------------------|--------|-------|
| Corporation tax rate (%) | τ | 30 |
| Capital allowances (%) | ϕ | |
| - intangibles | | 10 sl |
| - industrial buildings | | 4 sl |
| - machinery | | 25 db |
| Treatment of inventories | v | 1 |
| Personal tax rates (%) | | |
| - on interest income | m^i | 40 |
| - on dividend income | m^d | 32.5 |
| - on capital gains realisations | z^* | 14 |
| Imputation credit (%) | c | 10 |
| Effective real estate tax rate (%) | e | 1.60 |

The calculations here follow the formal methodology which is done in several steps.

B.1.1. Shareholder's Discount Rate and Tax Discrimination Variable

The shareholder's discount rate is defined as

$$\rho = \left(\frac{1 - m^i}{1 - z} \right) i.$$

Two elements of this must be found from the data in Tables B-1 and B-2 before this can be calculated. First, i is the nominal interest rate, found from the expression

$$i = (1 + r)(1 + \pi) - 1 = 0.071 = 7.1\%.$$

In the absence of personal taxes, then the shareholder's discount rate is simply this:

$$\rho = i = 7.1\% .$$

In the presence of personal taxes, it is necessary first to calculate the accruals-equivalent capital gains tax z . Capital gains tax is payable upon the sale of shares on the realised increase in share values. Effectively, the capital gains tax thus depends on whether and when increases in share value are realized. For the purpose of this report, it is assumed that the investor sells 10% of his remaining holding in each period. This fraction of shares that is turned over in each period is denoted by λ and, as explained, it is assumed to be 10%. Discounting the statutory tax levied on the realized capital gains (z^*) by $(1-m^i)i$, the net present value of tax payments for a one unit increase in the value of the asset is the accruals-equivalent capital gains tax rate z . In general, this is given by

$$z = \frac{\lambda z^*}{1 + (1-m^i)i} \left\{ 1 + \frac{1-\lambda}{1 + (1-m^i)i} + \left(\frac{1-\lambda}{1 + (1-m^i)i} \right)^2 + \left(\frac{1-\lambda}{1 + (1-m^i)i} \right)^3 + \dots \right\} = \frac{\lambda z^*}{\lambda + (1-m^i)i}$$

Taking the example of the UK, the statutory tax rate - z^* - falls the longer the asset is held. It also depends on whether the shareholder has a qualified participation or not. Taking the case of qualified participation, we estimate that the impact of this tapering relief is to give a value of $z^* = 14\%$. Using this value in the above formula yields

$$z = \frac{\lambda z^*}{\lambda + (1-m^i)i} = \frac{0.1 * 0.14}{0.1 + (1-0.4) * 0.071} = 0.0982 = 9.82\% .$$

In the presence of top-rate qualified personal taxpayers, then, the shareholder's discount rate is

$$\rho = \left(\frac{1-m^i}{1-z} \right) i = \left(\frac{1-0.4}{1-0.0982} \right) * 0.071 = 0.0472 = 4.72\% .$$

The tax discrimination variable is defined as

$$\gamma = \frac{(1-m^d)}{(1-z)(1-c)} .$$

In the absence of personal taxes $\gamma = 1$. For a top-rated shareholder, we obtain

$$\gamma = \frac{(1-0.325)}{(1-0.0982) * (1-0.1)} = 0.8316 .$$

B.1.2. Net Present Value of Capital Allowances

For capital allowances on a declining balance basis, the formula for the net present value of allowances per unit of investment is:

$$A = \frac{\tau\varphi}{1+\rho} \left\{ 1 + \left(\frac{1-\varphi}{(1+\rho)} \right) + \left(\frac{1-\varphi}{(1+\rho)} \right)^2 + \left(\frac{1-\varphi}{(1+\rho)} \right)^3 + \dots \right\} = \frac{\tau\varphi}{\varphi + \rho} .$$

In the UK, this applies machinery, which have an allowance rate of $\varphi = 0.25$. This implies for this asset in the absence of personal taxes

$$A_{MACH} = \frac{0.3 * 0.25}{0.25 + 0.071} = 0.2336$$

and in the presence of personal taxes of top-rate qualified shareholders is

$$A_{MACH} = \frac{0.3 * 0.25}{0.25 + 0.0472} = 0.2524.$$

Industrial buildings receive allowances on a straight line basis at 4% and intangible assets on a straight line basis at 10% per year. In general the formula in this case is

$$A = \tau \phi \left\{ \left(\frac{1}{(1 + \rho)} \right) + \left(\frac{1}{(1 + \rho)} \right)^2 + \dots + \left(\frac{1}{(1 + \rho)} \right)^T \right\}.$$

The values for industrial buildings and for intangibles in the UK in the absence of personal taxes are therefore

$$A_{BUILD} = 0.3 * 0.04 \left\{ \left(\frac{1}{(1 + 0.071)} \right) + \left(\frac{1}{(1 + 0.071)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.071)} \right)^{25} \right\} = 0.1386$$

$$A_{INTANG} = 0.3 * 0.1 \left\{ \left(\frac{1}{(1 + 0.071)} \right) + \left(\frac{1}{(1 + 0.071)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.071)} \right)^{10} \right\} = 0.2097$$

and in the presence of personal taxes of top-rate qualified shareholders they are

$$A_{BUILD} = 0.3 * 0.04 \left\{ \left(\frac{1}{(1 + 0.0472)} \right) + \left(\frac{1}{(1 + 0.0472)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.0472)} \right)^{25} \right\} = 0.1739$$

$$A_{INTANG} = 0.3 * 0.1 \left\{ \left(\frac{1}{(1 + 0.0472)} \right) + \left(\frac{1}{(1 + 0.0472)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.0472)} \right)^{10} \right\} = 0.2348.$$

B.1.3. Cost of capital

The cost of capital is defined as

$$\beta^c = \frac{(1 - A) \{ \rho + \delta(1 + \pi) - \pi \} + v\tau\pi + (1 + \rho)e}{(1 + \pi)(1 - \tau)} - \frac{F(1 + \rho)}{\gamma(1 + \pi)(1 - \tau)} - \delta.$$

F reflects the additional cost of raising external finance. It is defined as the net present value of cash flows which arise when investment is financed respectively by new equity or debt. Hence for the case of investment financed by retained earnings

$$F^{RE} = 0$$

and for the case of investment financed by new equity

$$F^{NE} = - \frac{\rho(1 - \gamma)(1 + e)}{1 + \rho}$$

and for the case of investment financed by debt

$$F^D = \frac{\gamma(1 + e)(\rho - i(1 - \tau))}{(1 + \rho)}.$$

Note that two terms have been added to the definition of the cost of capital. First, the term $v\tau\pi$ reflects the case of the taxation of financial assets and the taxation of inventories valued on a FIFO basis. In both cases, $v=1$ (in the case of LIFO, $v=0$; in case of weighted average cost method, v amounts to 0.5). This reflects, for example, the taxation of nominal interest payments. Second, the

term $(1 + \rho)e$ reflects real estate tax at rate e payable in the period in which the investment is undertaken. This also affects the amount of finance which must be raised and hence e also appears in both the finance terms, F^{NE} and F^D . In the UK, this applies only to industrial buildings.

Given the parameters set out above, we can find the cost of capital, denoted $\beta\%$, for a range of assets, sources of finance and personal taxes.

B.1.3.1. Only Corporate Taxes

Retained Earnings

(i) Intangibles:

$$\tilde{p}_{INTANG}^{RE} = \frac{(1 - 0.2097)}{(1 + 0.02) * (1 - 0.3)} \{0.071 + 0.1535 * (1 + 0.02) - 0.02\} - 0.1535 = 0.0762 \approx 7.6\%$$

(ii) Industrial buildings:

$$\tilde{p}_{BUILD}^{RE} = \frac{(1 - 0.1386) * \{0.071 + 0.031 * (1 + 0.02) - 0.02\} + 1.071 * 0.016}{(1 + 0.02) * (1 - 0.3)} - 0.031 = 0.0927 \approx 9.3\%$$

(iii) Machinery:

$$\tilde{p}_{MACH}^{RE} = \frac{(1 - 0.2336)}{(1 + 0.02) * (1 - 0.3)} \{0.071 + 0.175 * (1 + 0.02) - 0.02\} - 0.175 = 0.0713 \approx 7.1\%$$

(iv) Financial assets:

$$\tilde{p}_{FIN}^{RE} = \frac{1}{(1 + 0.02) * (1 - 0.3)} \{0.071 - 0.02 + 1 * 0.3 * 0.02\} = 0.0798 \approx 8.0\%$$

(v) Inventories:

$$\tilde{p}_{INVENT}^{RE} = \frac{1}{(1 + 0.02) * (1 - 0.3)} \{0.071 - 0.02 + 1 * 0.3 * 0.02\} = 0.0798 \approx 8.0\% .$$

New Equity

In the case of investment financed by new equity, the general expression is

$$\beta\%^{NE} = \beta\%^{RE} + \frac{\rho(1 - \gamma)(1 + e)}{\gamma(1 + \pi)(1 - \tau)} .$$

However, in the absence of personal taxes $\gamma = 1$. The last term is therefore always zero, and hence the cost of capital for investment financed by new equity is always the same as the cost of capital for investment financed by retained earnings.

Debt

(i) Intangibles

$$\beta\%_{INTANG}^D = \beta\%_{INTANG}^{RE} - \frac{(\rho - i(1 - \tau))}{(1 + \pi)(1 - \tau)} = 0.0762 - \frac{(0.071 - 0.071 * (1 - 0.3))}{(1 + 0.02) * (1 - 0.3)} = 0.0464 \approx 4.6\%$$

(ii) Industrial buildings:

$$\beta\%_{BUILD}^D = \beta\%_{BUILD}^{RE} - \frac{(1 + e)(\rho - i(1 - \tau))}{(1 + \pi)(1 - \tau)} = 0.0927 - \frac{(1 + 0.016)(0.071 - 0.071 * (1 - 0.3))}{(1 + 0.02) * (1 - 0.3)} = 0.0624 \approx 6.2\%$$

(iii) Machinery:

$$\beta\%_{MACH}^D = \beta\%_{MACH}^{RE} - \frac{(\rho - i(1 - \tau))}{(1 + \pi)(1 - \tau)} = 0.0713 - \frac{(0.071 - 0.071 * (1 - 0.3))}{(1 + 0.02) * (1 - 0.3)} = 0.0415 \approx 4.2\%$$

(iv) Financial assets:

$$\beta_{FIN}^D = \beta_{FIN}^{RE} - \frac{(\rho - i(1 - \tau))}{(1 + \pi)(1 - \tau)} = 0.0798 - \frac{(0.071 - 0.071 * (1 - 0.3))}{(1 + 0.02) * (1 - 0.3)} = 0.0500 = 5.0\%$$

(v) Inventories:

$$\beta_{INVENT}^D = \beta_{INVENT}^{RE} - \frac{(\rho - i(1 - \tau))}{(1 + \pi)(1 - \tau)} = 0.0798 - \frac{(0.071 - 0.071 * (1 - 0.3))}{1.02 * (1 - 0.3)} = 0.0500 = 5.0\%$$

B.1.3.2. Top Rate Qualified Shareholders

The calculation of cost of capital at the shareholder-level is shown only for retained earnings. The extension to other sources of finance is straightforward and follows the approach above in the absence of personal taxes.

Retained Earnings

(i) Intangibles:

$$\tilde{P}_{INTANG}^{RE} = \frac{(1 - 0.2348)}{(1 + 0.02) * (1 - 0.3)} \{0.0472 + 0.1535 * (1 + 0.02) - 0.02\} - 0.1535 = 0.0435 \approx 4.4\%$$

(ii) Industrial buildings:

$$\beta_{BUILD}^{RE} = \frac{(1 - 0.1739) * \{0.0472 + 0.031 * (1.02) - 0.02\} + 1.0472 * 0.016}{(1 + 0.02) * (1 - 0.3)} - 0.031 = 0.0605 \approx 6.1\%$$

(iii) Machinery:

$$\beta_{MACH}^{RE} = \frac{(1 - 0.2524)}{(1 + 0.02) * (1 - 0.3)} \{0.0472 + 0.175 * (1 + 0.02) - 0.02\} - 0.175 = 0.0404 \approx 4.0\%$$

(iv) Financial assets:

$$\tilde{P}_{FIN}^{RE} = \frac{1}{(1 + 0.02) * (1 - 0.3)} \{0.0472 - 0.02 + 0.3 * 0.02\} = 0.0466 \approx 4.7\%$$

(v) Inventories:

$$\tilde{P}_{INVENT}^{RE} = \frac{1}{(1 + 0.02) * (1 - 0.3)} \{0.0472 - 0.02 + 0.3 * 0.02\} = 0.0466 \approx 4.7\%$$

B.1.4. Effective Marginal Tax Rate (EMTR)

The effective marginal tax rate is defined as

$$EMTR = \frac{\beta\% - s}{\beta\%}$$

where s is the post-tax real rate of return from lending:

$$s = \frac{\{(1 - m^i)i - \pi\}}{1 + \pi}$$

B.1.4.1. Only Corporate Taxes

In the absence of personal taxes, s is simply the real interest rate, $r = 5\%$. In this case the EMTR is simply the difference between the cost of capital and r . To take an example, consider each of the assets when financed by retained earnings with corporation tax only.

$$EMTR_{INTANG} = \frac{0.0762 - 0.05}{0.0762} = 0.3442 \approx 34.4\%$$

$$EMTR_{BUILD} = \frac{0.0927 - 0.05}{0.0927} = 0.4605 \approx 46.1\%$$

$$EMTR_{MACH} = \frac{0.0713 - 0.05}{0.0713} = 0.2990 \approx 29.9\%$$

$$EMTR_{FIN} = \frac{0.0798 - 0.05}{0.0798} = 0.3737 \approx 37.4\%$$

$$EMTR_{INVENT} = \frac{0.0798 - 0.05}{0.0798} = 0.3737 \approx 37.4\%$$

where the cost of capital is taken from the above calculations.

B.1.4.2. Top Rate Qualified Shareholders

In the presence of personal taxes of a qualified top-rate shareholder,

$$s = \frac{\{(1-0.4) * 0.071 - 0.02\}}{(1 + 0.02)} = 0.02216 \approx 2.22\%$$

The EMTR in this case is found in exactly the same way. Again for the case of retained earnings, the EMTR in the presence of such personal taxes are:

$$EMTR_{INTANG} = \frac{0.0435 - 0.02216}{0.0435} = 0.4905 \approx 49.1\%$$

$$EMTR_{BUILD} = \frac{0.0606 - 0.02216}{0.0606} = 0.6342 \approx 63.4\%$$

$$EMTR_{MACH} = \frac{0.0404 - 0.02216}{0.0404} = 0.4520 \approx 45.2\%$$

$$EMTR_{FIN} = \frac{0.0466 - 0.02216}{0.0466} = 0.5240 \approx 52.4\%$$

$$EMTR_{INVENT} = \frac{0.0466 - 0.02216}{0.0466} = 0.5240 \approx 52.4\%$$

B.1.5. Effective Average Tax Rate (EATR)

The EATR is defined as

$$EATR = \frac{R^* - (1 - z)R}{p / (1 + r)},$$

where

$$R^* = \frac{p - r}{1 + r} = \frac{0.2 - 0.05}{1.05} = 0.1429$$

is the economic rent of the project in the absence of tax, and p is the assumed pre-tax real rate of return (assumed to be 20%). Hence the EATR can be written as

$$EATR = \frac{0.1429 - R}{0.2 / 1.05} = \frac{0.1429 - R}{0.1905}.$$

R is the economic rent of the project in the presence of tax, defined as

$$R = \frac{\gamma}{1 + \rho} \{ (p + \delta)(1 + \pi)(1 - \tau) - v\tau\pi - [\rho + \delta(1 + \pi) - \pi](1 - A) - (1 + \rho)e \} + F^{NE} + F^D$$

Values of R can be found for all the different forms of investment. Given these values it is straightforward to calculate the EATR. Here we present only the case of retained earnings, in the absence of personal taxes.

(i) Intangibles

$$\begin{aligned} R_{INTANG} &= \frac{1}{(1.071)} \{(0.2 + 0.1535) * 1.02 * (1 - 0.3) - [0.071 + 0.1535 * (1 + 0.02) - 0.02] * (1 - 0.2097)\} \\ &= 0.0825 \\ \Rightarrow EATR_{INTANG} &= \frac{0.1429 - 0.0825}{0.1905} = 0.3168 \approx 31.7\% \end{aligned}$$

(ii) Industrial Buildings

$$\begin{aligned} R_{BUILD} &= \frac{1}{(1 + 0.071)} \{(0.2 + 0.031) * 1.02 * 0.7 - [0.071 + 0.031 * 1.02 - 0.02](1 - 0.1386) - 1.071 * 0.016\} \\ &= 0.0715 \\ \Rightarrow EATR_{BUILD} &= \frac{0.1429 - 0.0715}{0.1905} = 0.3744 \approx 37.4\% \end{aligned}$$

(iii) Machinery

$$\begin{aligned} R_{MACH} &= \frac{1}{(1 + 0.071)} \{(0.2 + 0.175) * 1.02 * (1 - 0.3) - [0.071 + 0.175 * (1 + 0.02) - 0.02](1 - 0.2336)\} \\ &= 0.0858 \\ \Rightarrow EATR_{MACH} &= \frac{0.1429 - 0.0858}{0.1905} = 0.2996 \approx 30.0\% \end{aligned}$$

(iv) Financial assets

$$\begin{aligned} R_{FIN} &= \frac{1}{(1 + 0.071)} \{0.2 * (1 + 0.02) * (1 - 0.3) - 0.3 * 0.02 - [0.071 - 0.02]\} = 0.0801 \\ \Rightarrow EATR_{FIN} &= \frac{0.1429 - 0.0801}{0.1905} = 0.3294 \approx 32.9\% \end{aligned}$$

(v) Inventories

$$\begin{aligned} R_{INVENT} &= \frac{1}{(1 + 0.071)} \{0.2 * (1 + 0.02) * (1 - 0.3) - 0.3 * 0.02 - [0.071 - 0.02]\} = 0.0801 \\ \Rightarrow EATR_{INVENT} &= \frac{0.1429 - 0.0801}{0.1905} = 0.3294 \approx 32.9\% \end{aligned}$$

B.2. France: Worked Example for Domestic Investment

Table B-3 presents the essential elements of the French tax code.

Table B-3
Domestic Tax Parameters

| | | |
|--|----------|----------|
| Corporation tax rate (%) | τ | 34.93 |
| Capital allowances (%) | ϕ | |
| - intangibles | | 20 sl |
| - industrial buildings | | 5 sl |
| - machinery | | 32.14 sl |
| Treatment of inventories | v | 0.5 |
| Effective non income tax rate buildings (%) | e | 1.901 |
| Effective non income tax rate machinery (%) | e | 2.251 |
| Personal tax rates (%) | | |
| - on interest income | m^i | 27 |
| - on dividend income | m^d | 33.8 |
| - on capital gains realisations | z^* | 27 |
| Imputation credit (%) | c | 0 |
| Effective personal non income tax rate on lending(%) | α | 0.018 |
| Effective personal non income tax rate on shareholding (%) | β | 0 |

The calculations here follow the formal methodology which is done in several steps.

B.2.1. Shareholder's Discount Rate and Tax Discrimination Variable

The shareholder's discount rate is defined as

$$\rho = \left(\frac{(1 - m^i)i - \alpha + \beta}{1 + z} \right) i.$$

Two elements of this must be found from the data in Tables B-1 and B-3 before this can be calculated. First, i is the nominal interest rate, found from the expression

$$i = (1 + r)(1 + \pi) - 1 = 0.071 = 7.1\% .$$

In the absence of personal taxes, then the shareholder's discount rate is simply this:

$$\rho = i = 7.1\% .$$

In the presence of personal taxes, it is necessary first to calculate the accruals-equivalent capital gains tax rate, z . This is done by making the assumption that, following an increase in the value of an asset, the investor sells 10% of his remaining holding in each period. Discounting at $(1 - m^i)i$, the net present value of tax payments for a one unit increase in the value of the asset is the accrual equivalent capital gains tax rate. In general, this is given by

$$z = \frac{\lambda z^*}{\lambda + (1 - m^i)i - \alpha} .$$

Using this value in the above formula yields

$$z = \frac{0.1 * 0.27}{0.1 + (1 - 0.27) * 0.071 - 0.018} = 0.2017 = 20.2\% .$$

In the presence of top-rate qualified personal taxpayers, then, the shareholder's discount rate is

$$\rho = \frac{(1 - m^i)i - \alpha + \beta}{1 - z} = \frac{(1 - 0.27) * 0.071 - 0.018 + 0.0}{1 - 0.2017} = 0.0424 = 4.2\% .$$

The tax discrimination variable is defined as

$$\gamma = \frac{(1 - m^d)}{(1 - z)(1 - c)}.$$

In the absence of personal taxes $\gamma = 1$. For a top-rated shareholder, we obtain

$$\gamma = \frac{(1 - 0.27)}{(1 - 0.2017)(1 - 0)} = 0.9144.$$

B.2.2. Net Present Value of Capital Allowances

Machinery receive allowances on a declining balance basis at 32.14% and a switch over after 4 year is available, i.e. a total depreciation period of 7 years.

$$A_{MACH} = 0.3493 * \left\{ \left(\frac{0.3214}{(1 + 0.071)} \right) + \left(\frac{0.2181}{(1 + 0.071)} \right)^2 + \dots + \left(\frac{0.048}{(1 + 0.071)} \right)^6 + \left(\frac{0.048}{(1 + 0.071)} \right)^7 \right\} = 0.2891$$

Industrial buildings receive allowances on a straight line basis at 5% and intangibles on a straight line basis at 20% per year. The value for industrial buildings in France in the absence of personal taxes is therefore

$$A_{BUILD} = 0.3493 * 0.05 \left\{ \left(\frac{1}{1 + 0.071} \right) + \left(\frac{1}{1 + 0.071} \right)^2 + \dots + \left(\frac{1}{1 + 0.071} \right)^{20} \right\} = 0.1836$$

$$A_{INTANG} = 0.3493 * 0.2 \left\{ \left(\frac{1}{1 + 0.071} \right) + \left(\frac{1}{1 + 0.071} \right)^2 + \dots + \left(\frac{1}{1 + 0.071} \right)^5 \right\} = 0.2857$$

In the presence of personal taxes of top-rate qualified shareholders, we obtain

$$A_{MACH} = 0.3493 * \left\{ \left(\frac{0.3214}{(1 + 0.0424)} \right) + \left(\frac{0.2181}{(1 + 0.0424)} \right)^2 + \dots + \left(\frac{0.048}{(1 + 0.0424)} \right)^6 + \left(\frac{0.048}{(1 + 0.0424)} \right)^7 \right\} = 0.3110$$

$$A_{BUILD} = 0.3493 * 0.05 \left\{ \left(\frac{1}{(1 + 0.0424)} \right) + \left(\frac{1}{(1 + 0.0424)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.0424)} \right)^{20} \right\} = 0.2324$$

$$A_{INTANG} = 0.3493 * 0.2 \left\{ \left(\frac{1}{(1 + 0.0424)} \right) + \left(\frac{1}{(1 + 0.0424)} \right)^2 + \dots + \left(\frac{1}{(1 + 0.0424)} \right)^5 \right\} = 0.3089.$$

B.2.3. Cost of Capital

The cost of capital is defined as

$$\tilde{p} = \frac{(1 - A) \{ \rho + \delta(1 + \pi) - \pi \} + v\tau\pi + (1 + \rho)e}{(1 + \pi)(1 - \tau)} - \frac{F(1 + \rho)}{\gamma(1 + \pi)(1 - \tau)} - \delta$$

where for the case of investment financed by new equity

$$F^{NE} = - \frac{\rho(1 - \gamma)(1 + e)}{1 + \rho}$$

and for the case of investment financed by debt

$$F^D = \frac{\gamma(1 + e)(\rho - i(1 - \tau))}{(1 + \rho)}.$$

Note that two terms have been added to the definition of the cost of capital. First, the term $\nu\tau\pi$ reflects the case of the taxation of financial assets, where $\nu=1$, and inventories valued on a weighted average costs basis, where $\nu=0.5$. These reflect, for example, the taxation of nominal interest payments. Second, the term $(1+\rho)e$ reflects a non-profit tax at rate e payable in the period in which the investment is undertaken. This also affects the amount of finance which must be raised and hence e also appears in both the finance terms, F^{NE} and F^D . In France, this applies to industrial buildings and machinery.

Given the parameters set out above, we can find the cost of capital, denoted $\beta\%$, for a range of assets, sources of finance and personal taxes.

B.2.3.1. Only Corporate Taxes

Retained Earnings

(i) Intangibles:

$$\tilde{p}_{INTANG}^{RE} = \frac{(1-0.2857)*(0.071+0.1535*1.02-0.02)}{(1+0.02)*(1-0.3493)} - 0.1535 = 0.0699 \approx 7.0\%$$

(ii) Industrial buildings:

$$\tilde{p}_{BUILD}^{RE} = \frac{(1-0.1836)*(0.071+0.031*1.02-0.02)+1.071*0.019}{(1+0.02)*(1-0.3493)} - 0.031 = 0.1013 \approx 10.1\%$$

(iii) Machinery:

$$\tilde{p}_{MACH}^{RE} = \frac{(1-0.2891)*(0.071+0.175*1.02-0.02)+1.071*0.0225}{(1+0.02)*(1-0.3493)} - 0.175 = 0.1071 \approx 10.7\%$$

(iv) Financial assets:

$$\tilde{p}_{FIN}^{RE} = \frac{0.071-0.02+1*0.3493*0.02}{(1+0.02)*(1-0.3493)} = 0.0874 \approx 8.7\%$$

(v) Inventories:

$$\tilde{p}_{INVENT}^{RE} = \frac{0.071-0.02+0.5*0.3493*0.02}{(1+0.02)*(1-0.3493)} = 0.0821 \approx 8.2\%$$

New Equity

In the case of investment financed by new equity, the general expression is

$$\tilde{p}^{NE} = \tilde{p}^{RE} + \frac{\rho(1-\gamma)(1+e)}{\gamma(1+\pi)(1-\tau)}$$

However, in the absence of personal taxes, $\gamma=1$. The last term is therefore always zero, and hence the cost of capital for investment financed by new equity is always the same as the cost of capital for investment financed by retained earnings.

Debt

(i) Intangibles

$$\beta_{INTANG}^D = \beta_{INTANG}^{RE} - \frac{(\rho-i(1-\tau))}{(1+\pi)(1-\tau)} = 0.0699 - \frac{(0.071-0.071*(1-0.3493))}{(1+0.02)*(1-0.3493)} = 0.0325 \approx 3.3\%$$

(ii) Industrial buildings:

$$\begin{aligned} \rho_{BUILD}^D &= \rho_{BUILD}^{RE} - \frac{(1+e)(\rho-i(1-\tau))}{(1+\pi)(1-\tau)} \\ &= 0.1013 - \frac{(1+0.019)(0.071-0.071*(1-0.3493))}{(1+0.02)*(1-0.3493)} = 0.0632 \approx 6.3\% \end{aligned}$$

(iii) Machinery:

$$\begin{aligned} \rho_{MACH}^D &= \rho_{MACH}^{RE} - \frac{(1+e)(\rho-i(1-\tau))}{(1+\pi)(1-\tau)} \\ &= 0.1071 - \frac{(1+0.0225)(0.071-0.071*(1-0.3493))}{(1+0.02)*(1-0.3493)} = 0.00689 \approx 6.9\% \end{aligned}$$

(iv) Financial assets:

$$\rho_{FIN}^D = \rho_{FIN}^{RE} - \frac{(\rho-i(1-\tau))}{(1+\pi)(1-\tau)} = 0.0874 - \frac{(0.071-0.071*(1-0.3493))}{(1+0.02)*(1-0.3493)} = 0.0500 = 5.0\%$$

(v) Inventories:

$$\rho_{INVENT}^D = \rho_{INVENT}^{RE} - \frac{(\rho-i(1-\tau))}{(1+\pi)(1-\tau)} = 0.0821 - \frac{(0.071-0.071*(1-0.3493))}{(1+0.02)*(1-0.3493)} = 0.0447 \approx 4.5\%$$

B.2.3.2. Top Rate Qualified Shareholders

This case is shown only for retained earnings. The extension to other sources of finance is straightforward and follows the approach above in the absence of personal taxes.

Retained Earnings

(i) Intangibles:

$$\tilde{\rho}_{INTANG}^{RE} = \frac{(1-0.3089)*(0.0424+0.1535*(1+0.02)-0.02)}{(1+0.02)*(1-0.3493)} - 0.1535 = 0.0328 \approx 3.3\%$$

(ii) Industrial buildings:

$$\tilde{\rho}_{BUILD}^{RE} = \frac{(1-0.2324)*(0.0424+0.031*(1+0.02)-0.02)+1.0424*0.019}{(1+0.02)*(1-0.3493)} - 0.031 = 0.0613 \approx 6.1\%$$

(iii) Machinery:

$$\tilde{\rho}_{MACH}^{RE} = \frac{(1-0.3110)*(0.0424+0.175*(1+0.02)-0.02)+1.0424*0.0225}{(1+0.02)*(1-0.3493)} - 0.175 = 0.0689 \approx 6.9\%$$

(iv) Financial assets:

$$\tilde{\rho}_{FIN}^{RE} = \frac{0.0424-0.02+0.3493*0.02}{(1+0.02)*(1-0.3493)} = 0.0442 \approx 4.4\%$$

(v) Inventories:

$$\tilde{\rho}_{INVENT}^{RE} = \frac{0.0424-0.02+0.3493*0.02*0.5}{(1+0.02)*(1-0.3493)} = 0.0390 \approx 3.9\%$$

B.2.4. Effective Marginal Tax Rate (EMTR)

The effective marginal tax rate is defined as

$$EMTR = \frac{\tilde{\rho} - s}{\tilde{\rho}}$$

B.2.4.1. Only Corporate Taxes

In the absence of personal taxes, s is simply the real interest rate, $r = 5\%$. In this case the EMTR is simply the difference between the cost of capital and r . To take an example, consider each of the assets when financed by retained earnings with corporation tax only.

$$EMTR_{INTANG} = \frac{0.0699 - 0.05}{0.0699} = 0.2847 \approx 28.5\%$$

$$EMTR_{BUILD} = \frac{0.1013 - 0.05}{0.1013} = 0.5064 \approx 50.6\%$$

$$EMTR_{MACH} = \frac{0.1071 - 0.05}{0.1071} = 0.5332 \approx 53.32\%$$

$$EMTR_{FIN} = \frac{0.0874 - 0.05}{0.0874} = 0.4277 \approx 42.8\%$$

$$EMTR_{INVENT} = \frac{0.0821 - 0.05}{0.0821} = 0.3910 \approx 39.1\%$$

where the cost of capital is taken from the above calculations.

B.2.4.2. Top Rate Qualified Shareholders

In the presence of personal taxes of a qualified top-rate shareholder,

$$s = \frac{(1 - 0.27) * 0.071 - 0.02 - 0.018 + 0}{(1 + 0.02)} = 0.0136 \approx 1.36\%$$

The EMTR in this case is found in exactly the same way. Again for the case of retained earnings, the EMTR in the presence of such personal taxes are:

$$EMTR_{INTANG} = \frac{0.0328 - 0.0136}{0.0328} = 0.5869 \approx 58.7\%$$

$$EMTR_{BUILD} = \frac{0.0613 - 0.0136}{0.0613} = 0.7788 \approx 77.9\%$$

$$EMTR_{MACH} = \frac{0.0689 - 0.0136}{0.0689} = 0.8032 \approx 80.3\%$$

$$EMTR_{FIN} = \frac{0.0442 - 0.0136}{0.0442} = 0.6936 \approx 69.4\%$$

$$EMTR_{INVENT} = \frac{0.0390 - 0.0136}{0.0390} = 0.6522 \approx 65.2\%$$

B.2.5. Effective Average Tax Rate (EATR)

The EATR is defined as

$$EATR = \frac{R^* - (1 - z)R}{p/(1 + r)},$$

where

$$R^* = \frac{p - r}{1 + r} = \frac{0.2 - 0.05}{1.05} = 0.1429$$

is the economic rent of the project in the absence of tax, and p is the assumed pre-tax real rate of return (assumed to be 20%). Hence the EATR can be written as

$$EATR = \frac{0.1429 - R}{0.2/1.05} = \frac{0.1429 - R}{0.1905}.$$

R is the economic rent of the project in the presence of tax, defined as

$$R = \frac{\gamma}{1+\rho} \{(p + \delta)(1 + \pi)(1 - \tau) - v\tau\pi - [\rho + \delta(1 + \pi) - \pi](1 - A) - (1 + \rho)e\} + F^{NE} + F^{DE}$$

Values of R can be found for all the different forms of investment. Given these values it is straightforward to calculate the EATR. Here we present only the case of retained earnings, in the absence of personal taxes.

(i) Intangibles

$$\begin{aligned} R_{INTANG} &= \frac{1}{1.071} \{(0.2 + 0.1535) * 1.02 * (1 - 0.3493) - [0.071 + 0.1535 * (1.02) - 0.02] * (1 - 0.2857)\} \\ &= 0.0806 \\ \Rightarrow EATR_{INTANG} &= \frac{0.1429 - 0.0806}{0.1905} = 0.3267 \approx 32.7\% \end{aligned}$$

(ii) Industrial buildings

$$\begin{aligned} R_{BUILD} &= \frac{1}{1.071} \{(0.2 + 0.031) * 1.02 * (1 - 0.3493) - [0.071 + 0.031 * 1.02 - 0.02](1 - 0.1836) - 1.071 * 0.019\} \\ &= 0.0612 \\ \Rightarrow EATR_{BUILD} &= \frac{0.1429 - 0.0612}{0.1905} = 0.4289 \approx 42.9\% \end{aligned}$$

(iii) Machinery

$$\begin{aligned} R_{MACH} &= \frac{1}{1.071} \{(0.2 + 0.175) * 1.02 * (1 - 0.3493) - [0.071 + 0.175 * 1.02 - 0.02](1 - 0.2891) - 1.071 * 0.0225\} \\ &= 0.0576 \\ \Rightarrow EATR_{MACH} &= \frac{0.1429 - 0.0576}{0.1905} = 0.4478 \approx 44.8\% \end{aligned}$$

(iv) Financial assets

$$\begin{aligned} R_{FIN} &= \frac{1}{(1 + 0.071)} \{0.2 * (1 + 0.02) * (1 - 0.3493) - 0.3493 * 0.02 - [0.071 - 0.02]\} = 0.0698 \\ \Rightarrow EATR_{FIN} &= \frac{0.1429 - 0.0698}{0.1905} = 0.3835 \approx 38.4\% \end{aligned}$$

(v) Inventories

$$\begin{aligned} R_{INVENT} &= \frac{1}{(1 + 0.071)} \{0.2 * (1 + 0.02) * (1 - 0.3493) - 0.5 * 0.3493 * 0.02 - [0.071 - 0.02]\} = 0.0731 \\ \Rightarrow EATR_{INVENT} &= \frac{0.1429 - 0.0731}{0.1905} = 0.3664 \approx 36.6\% \end{aligned}$$

B.3. Austria: Worked Example for Cross-Border Investment

The following example corresponds to an investment in Austria, which is carried out by a foreign parent corporation located a) in France or b) in the United Kingdom.

The calculations consider the parameters of the Austrian tax system as the subsidiary location. The parameters are denoted by a subscript s when the tax parameters reflect the tax system of the subsidiary, here Austria. Table B-4 shows the tax parameters of the Austrian subsidiary.

Table B-4**Tax Parameters of the Austrian subsidiary**

| | | |
|------------------------------------|----------|----------|
| Corporation tax rate (%) | τ_s | 25 |
| Capital allowances (%) | ϕ_s | |
| - intangibles | | 10 sl |
| - industrial buildings | | 3 sl |
| - machinery | | 14.29 sl |
| Treatment of inventories | ν_s | 0 |
| Effective real estate tax rate (%) | e_s | 0.188 |

Additionally, some aspects of the parent company country's tax system are relevant in the case of a cross-border investment, e.g. the taxation of foreign dividends repatriated or inter-company interest payments. The tax parameters are denoted by a subscript p . Table B-5 shows the tax parameters which are relevant in the case of a parent company located in France.

Table B-5**Tax Parameters of the parent company located in France**

| | | |
|--|----------|------------------------|
| Corporation tax rate (%) | τ_p | 34.93 |
| Treatment of foreign inter-company dividends | | 95% Exemption |
| Treatment of foreign inter-company interest | | Credit with limitation |
| Withholding tax rate on dividends from Austria (%) | w^D | 0 |
| Withholding tax rate on interest from Austria (%) | w^I | 0 |

Furthermore, Table B-6 shows the tax parameters which are relevant in the case of a parent company located in the United Kingdom.

Table B-6**Tax Parameters of the parent company located in the United Kingdom**

| | | |
|--|----------|------------------------|
| Corporation tax rate (%) | τ_p | 30 |
| Treatment of foreign inter-company dividends | | Credit with limitation |
| Treatment of foreign inter-company interest | | Credit with limitation |
| Withholding tax rate on dividends from Austria (%) | w^D | 0 |
| Withholding tax rate on interest from Austria (%) | w^I | 0 |

B.3.1. Shareholder's Discount Rate

The shareholder's discount rate is defined as

$$\rho_p = \left(\frac{1 - m^i}{1 + z} \right) i.$$

Two elements of this must be found from the data in Tables B-1 and B-4 before this can be calculated. First, i is the nominal interest rate, found from the expression

$$i = (1 + r)(1 + \pi) - 1 = 0.071 = 7.1\%.$$

In the absence of personal taxes, then the shareholders' discount rate is simply this:

$$\rho_p = i = 7.1\%.$$

B.3.2. Net Present Value of Capital Allowances

Since the investment takes place in Austria, the Austrian depreciation rules are applied irrespective of the parent company's location.

Industrial buildings receive allowances on a straight line basis at 3% and intangibles on a straight line basis at 10% per year, where the depreciation rate for machinery is 14.29%. In general the formula in this case is

$$A = \tau \phi \left\{ \left(\frac{1}{(1+\rho)} \right) + \left(\frac{1}{(1+\rho)} \right)^2 + \dots + \left(\frac{1}{(1+\rho)} \right)^T \right\}.$$

The value for industrial buildings in Austria in the absence of personal taxes is therefore

$$A_{S,MACH} = 0.25 * 0.1429 \left\{ \left(\frac{1}{(1+0.071)} \right) + \left(\frac{1}{(1+0.071)} \right)^2 + \dots + \left(\frac{1}{(1+0.071)} \right)^7 \right\} = 0.1919$$

$$A_{S,BUILD} = 0.25 * 0.03 \left\{ \left(\frac{1}{(1+0.071)} \right) + \left(\frac{1}{(1+0.071)} \right)^2 + \dots + \left(\frac{0.33}{(1+0.071)} \right)^{34} \right\} = 0.0949$$

$$A_{S,INTANG} = 0.25 * 0.1 \left\{ \left(\frac{1}{(1+0.071)} \right) + \left(\frac{1}{(1+0.071)} \right)^2 + \dots + \left(\frac{1}{(1+0.071)} \right)^{10} \right\} = 0.1748$$

B.3.3. Taxation of Inter-Company Dividends and Interest Payments

The calculation is extended by a parameter σ reflecting the taxation of foreign dividends repatriated from the subsidiary. In the case of an exemption system only withholding taxes on dividend payments w^D are relevant. However, foreign dividends are often partly tax exempt, for example, in France at 95%. Then we obtain

$$\sigma = 0.05\tau_p + w^D.$$

In the case of credit system, foreign dividends are taxed at the parent company. However, the foreign taxes paid can be credited within the limitation of the parent company's tax rate. Then, we obtain

$$\sigma = \max \left[w^D; \frac{\tau_p - \tau_s}{1 - \tau_s} \right].$$

For an investment in Austria carried out by a French parent corporation, it follows that

$$\sigma = 0.05\tau_p + w^D = 0.05 * 0.3493 + 0 = 0.017465$$

In the case of a parent corporation from the United Kingdom, σ is

$$\sigma = \max \left[w^D; \frac{\tau_p - \tau_s}{1 - \tau_s} \right] = \max \left[0; \frac{0.30 - 0.25}{0.75} \right] = 0.0666.$$

Furthermore, the calculation is extended by a parameter ω reflecting the taxation of foreign inter-company interest payments. The interest is taxed at the parent corporation level and can be deducted at the subsidiary level. However, foreign tax payments can be credited within limitations. Then, we obtain

$$\omega = \max \left[\tau_p; w^I \right] - \tau_s.$$

For an investment in Austria carried out by a parent company from France, ω is,

$$\omega = \max[0.3493; 0] - 0.25 = 0.0993,$$

and in the case of a parent company from the United Kingdom

$$\omega = \max[0.30; 0] - 0.25 = 0.05.$$

B.3.4. Effective Average Tax Rate (EATR) in the Case of Cross-Border Investments

The EATR is defined as

$$EATR = \frac{R^* - (1 - z)R}{p/(1 + r)},$$

where

$$R^* = \frac{p - r}{1 + r} = \frac{0.2 - 0.05}{1.05} = 0.1429$$

is the economic rent of the project in the absence of tax, and p is the assumed pre-tax real rate of return (assumed to be 20%). Hence the EATR can be written as

$$EATR = \frac{0.1429 - R}{0.2/1.05} = \frac{0.1429 - R}{0.1905}.$$

R is the economic rent of the project in the presence of tax, defined as

$$R = \frac{\gamma_P(1 - \sigma)}{1 + \rho_P} \{ (p_S + \delta)(1 + \pi)(1 - \tau_S) - v_S \tau_S \pi - [\rho_P + \delta(1 + \pi) - \pi](1 - A_S) - (1 + \rho_P)e_S \} \\ + F_P^{NE} + F_P^D + F_S^{NE} + F_S^D$$

Values of R can be found for all the different forms of investment. Given these values it is straightforward to calculate the EATR. Here we present only focus on the corporate level without considering personal taxes.

For the case of investment financed by the new equity, we add

$$F_P^{NE} = -\frac{\rho_P(1 - \gamma_P)(1 + e_S)}{1 + \rho_P}$$

and for the case of investment financed by debt

$$F_P^D = \frac{\gamma_P(1 + e_S)(\rho_P - i(1 - \tau_P))}{(1 + \rho_P)}.$$

Additionally, the effects of different sources of finance of the subsidiary are considered by

$$F_S^{NE} = -\frac{\rho_P \gamma_P \sigma (1 + e_S)}{1 + \rho_P}$$

and by

$$F_S^D = -\gamma_P \sigma (1 + e_S) + \frac{\gamma_P (1 + e_S) [\sigma (1 + i(1 - \tau_S)) - i\omega]}{1 + \rho_P}.$$

We present the case of retained earnings as the sources of re-finance of the parent corporations. However, the following calculations consider three different sources of finance of the subsidiary.

B.3.4.1. Retained Earnings as Sources of Finance of the Subsidiary

(i) Intangibles

Parent company located in France:

$$\begin{aligned}R_{INTANG}^{RE,RE} &= \frac{1-0.017465}{(1+0.071)} \{(0.2+0.1535)*1.02*(1-0.25) - [0.071+0.1535*1.02-0.02]*(1-0.1748)\} \\ &= 0.0909 \\ \Rightarrow EATR_{INTANG}^{RE,RE} &= \frac{0.1429-0.0909}{0.1905} = 0.2725 \approx 27.3\%\end{aligned}$$

Parent company located in the United Kingdom:

$$\begin{aligned}R_{INTANG}^{RE,RE} &= \frac{1-0.0667}{(1+0.071)} \{(0.2+0.1535)*1.02*(1-0.25) - [0.071+0.1535*1.02-0.02]*(1-0.1748)\} \\ &= 0.0864 \\ \Rightarrow EATR_{INTANG}^{RE,RE} &= \frac{0.1429-0.0864}{0.1905} = 0.2964 \approx 29.6\%\end{aligned}$$

(ii) Industrial buildings

Parent company located in France:

$$\begin{aligned}R_{BUILD}^{RE,RE} &= \frac{1-0.0175}{(1.071)} \{(0.2+0.031)*1.02*(0.75) - [0.071+0.031*1.02-0.02]*(1-0.0949) - 0.0019*1.071\} \\ &= 0.0917 \\ \Rightarrow EATR_{BUILD}^{RE,RE} &= \frac{0.1429-0.0917}{0.1905} = 0.2687 \approx 26.9\%\end{aligned}$$

Parent company located in the United Kingdom:

$$\begin{aligned}R_{BUILD}^{RE,RE} &= \frac{1-0.0667}{(1.071)} \{(0.2+0.031)*1.02*(1-0.25) - [0.071+0.031*1.02-0.02]*(1-0.0949) - 0.0019*1.071\} \\ &= 0.0871 \\ \Rightarrow EATR_{BUILD}^{RE,RE} &= \frac{0.1429-0.0871}{0.1905} = 0.2928 \approx 29.3\%\end{aligned}$$

(iii) Machinery

Parent company located in France:

$$\begin{aligned}R_{MACH}^{RE,RE} &= \frac{1-0.017465}{(1+0.071)} \{(0.2+0.175)*1.02*(1-0.25) - [0.071+0.175*1.02-0.02]*(1-0.1919)\} \\ &= 0.0930 \\ \Rightarrow EATR_{MACH}^{RE,RE} &= \frac{0.1429-0.0930}{0.1905} = 0.2616 \approx 26.2\%\end{aligned}$$

Parent company located in the United Kingdom:

$$\begin{aligned}R_{MACH}^{RE,RE} &= \frac{1-0.0667}{(1+0.071)} \{(0.2+0.175)*1.02*(1-0.25) - [0.071+0.175*1.02-0.02]*(1-0.1919)\} \\ &= 0.0884 \\ \Rightarrow EATR_{MACH}^{RE,RE} &= \frac{0.1429-0.0884}{0.1905} = 0.2861 \approx 28.6\%\end{aligned}$$

(iv) Financial assets

Parent company located in France:

$$R_{FIN}^{RE,RE} = \frac{1 - 0.017465}{(1 + 0.071)} \{0.2 * 1.02 * (1 - 0.25) - [0.071 - 0.02] - 0.25 * 0.02\} = 0.0889$$
$$\Rightarrow EATR_{FIN}^{RE,RE} = \frac{0.1429 - 0.0889}{0.1905} = 0.2828 \approx 28.3\%$$

Parent company located in the United Kingdom:

$$R_{FIN}^{RE,RE} = \frac{1 - 0.0667}{(1 + 0.071)} \{0.2 * 1.02 * (1 - 0.25) - [0.071 - 0.02] - 0.25 * 0.02\} = 0.0845$$
$$\Rightarrow EATR_{FIN}^{RE,RE} = \frac{0.1429 - 0.0845}{0.1905} = 0.3062 \approx 30.6\%$$

(v) Inventories

Parent company located in France:

$$R_{INVENT}^{RE,RE} = \frac{1 - 0.017465}{(1 + 0.071)} \{0.2 * 1.02 * (1 - 0.25) - [0.071 - 0.02]\} = 0.0936$$
$$\Rightarrow EATR_{INVENT}^{RE,RE} = \frac{0.1429 - 0.0936}{0.1905} = 0.2587 \approx 25.9\%$$

Parent company located in the United Kingdom:

$$R_{INVENT}^{RE,RE} = \frac{1 - 0.0667}{(1 + 0.071)} \{0.2 * 1.02 * (1 - 0.25) - [0.071 - 0.02]\} = 0.0888$$
$$\Rightarrow EATR_{INVENT}^{RE,RE} = \frac{0.1429 - 0.0888}{0.1905} = 0.2833 \approx 28.3\%$$

B.3.5. New Equity as Sources of Finance of the Subsidiary

(i) Intangibles

Parent company located in France:

$$R_{INTANG}^{RE,NE} = 0.0909 - \frac{0.071 * 0.017465}{(1 + 0.071)} = 0.0898$$
$$\Rightarrow EATR_{INTANG}^{RE,NE} = \frac{0.1429 - 0.0898}{0.1905} = 0.2786 \approx 27.9\%$$

Parent company located in the United Kingdom:

$$R_{INTANG}^{RE,NE} = 0.0864 - \frac{0.071 * 0.0667}{(1 + 0.071)} = 0.0820$$
$$\Rightarrow EATR_{INTANG}^{RE,NE} = \frac{0.1429 - 0.0820}{0.1905} = 0.3196 \approx 32.0\%$$

(ii) Industrial buildings

Parent company located in France:

$$R_{BUILD}^{RE,NE} = 0.0917 - \frac{0.071 * 0.017465 * (1.0019)}{(1 + 0.071)} = 0.0905$$
$$\Rightarrow EATR_{BUILD}^{RE,NE} = \frac{0.1429 - 0.0905}{0.1905} = 0.2748 \approx 27.5\%$$

Parent company located in the United Kingdom:

$$R_{BUILD}^{RE,NE} = 0.0871 - \frac{0.071 * 0.0667 * (1.0019)}{(1 + 0.071)} = 0.0827$$

$$\Rightarrow EATR_{BUILD}^{RE,NE} = \frac{0.1429 - 0.0827}{0.1905} = 0.3161 \approx 31.6\%$$

(iii) Machinery

Parent company located in France:

$$R_{MACH}^{RE,NE} = 0.0930 - \frac{0.071 * 0.017465}{(1 + 0.071)} = 0.0919$$

$$\Rightarrow EATR_{MACH}^{RE,NE} = \frac{0.1429 - 0.0919}{0.1905} = 0.2677 \approx 26.8\%$$

Parent company located in the United Kingdom:

$$R_{MACH}^{RE,NE} = 0.0884 - \frac{0.071 * 0.0667}{(1 + 0.071)} = 0.0839$$

$$\Rightarrow EATR_{MACH}^{RE,NE} = \frac{0.1429 - 0.0839}{0.1905} = 0.3093 \approx 30.9\%$$

(iv) Financial assets

Parent company located in France:

$$R_{FIN}^{RE,NE} = 0.0889 - \frac{0.071 * 0.017465}{(1 + 0.071)} = 0.0878$$

$$\Rightarrow EATR_{FIN}^{RE,NE} = \frac{0.1429 - 0.0878}{0.1905} = 0.2889 \approx 28.9\%$$

Parent company located in the United Kingdom:

$$R_{FIN}^{RE,NE} = 0.0845 - \frac{0.071 * 0.0667}{(1 + 0.071)} = 0.0801$$

$$\Rightarrow EATR_{FIN}^{RE,NE} = \frac{0.1429 - 0.0801}{0.1905} = 0.3294 \approx 32.9\%$$

(v) Inventories

Parent company located in France:

$$R_{INVENT}^{RE,NE} = 0.0936 - \frac{0.071 * 0.017465}{(1 + 0.071)} = 0.0924$$

$$\Rightarrow EATR_{INVENT}^{RE,NE} = \frac{0.1429 - 0.0924}{0.1905} = 0.2648 \approx 26.5\%$$

Parent company located in the United Kingdom:

$$R_{INVENT}^{RE,NE} = 0.0888 - \frac{0.071 * 0.0667}{(1 + 0.071)} = 0.0845$$

$$\Rightarrow EATR_{INVENT}^{RE,NE} = \frac{0.1429 - 0.0845}{0.1905} = 0.3065 \approx 30.7\%$$

B.3.6. Debt as Sources of Finance of the Subsidiary

(i) Intangibles

Parent company located in France:

$$R_{INTANG}^{RE,D} = 0.0909 - 0.017465 + \frac{0.017465 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.0993}{(1 + 0.071)} = 0.0841$$

$$\Rightarrow EATR_{INTANG}^{RE,D} = \frac{0.1429 - 0.0841}{0.1905} = 0.3086 \approx 30.9\%$$

Parent company located in the United Kingdom:

$$R_{INTANG}^{RE,D} = 0.0864 - 0.0667 + \frac{0.0667 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.05}{(1 + 0.071)} = 0.0820$$

$$\Rightarrow EATR_{INTANG}^{RE,D} = \frac{0.1429 - 0.0820}{0.1905} = 0.3196 \approx 32.0\%$$

(ii) Industrial Buildings

Parent company located in France:

$$R_{BUILD}^{RE,D} = 0.0917 - 0.017465 * 1.0019 + \frac{1.0019 * [0.017465 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.0993]}{(1 + 0.071)}$$

$$= 0.0845$$
$$\Rightarrow EATR_{BUILD}^{RE,D} = \frac{0.1429 - 0.0845}{0.1905} = 0.3048 \approx 30.5\%$$

Parent company located in the United Kingdom:

$$R_{BUILD}^{RE,D} = 0.0871 - 0.0667 * 1.0019 + \frac{1.0019 * [0.0667 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.05]}{(1 + 0.071)} = 0.0827$$

$$\Rightarrow EATR_{BUILD}^{RE,D} = \frac{0.1429 - 0.0827}{0.1905} = 0.3161 \approx 31.6\%$$

(iii) Machinery

Parent company located in France:

$$R_{MACH}^{RE,D} = 0.0930 - 0.017465 + \frac{0.017465 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.0993}{(1 + 0.071)} = 0.0861$$

$$\Rightarrow EATR_{MACH}^{RE,D} = \frac{0.1429 - 0.0861}{0.1905} = 0.2977 \approx 29.8\%$$

Parent company located in the United Kingdom:

$$R_{MACH}^{RE,D} = 0.0884 - 0.0667 + \frac{0.0667 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.05}{(1 + 0.071)} = 0.0839$$

$$\Rightarrow EATR_{MACH}^{RE,D} = \frac{0.1429 - 0.0839}{0.1905} = 0.3093 \approx 30.9\%$$

(iv) Financial assets

Parent company located in France:

$$R_{FIN}^{RE,D} = 0.0889 - 0.017465 + \frac{0.017465 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.0993}{(1 + 0.071)} = 0.0821$$

$$\Rightarrow EATR_{FIN}^{RE,D} = \frac{0.1429 - 0.0821}{0.1905} = 0.3189 \approx 31.9\%$$

Parent company located in the United Kingdom:

$$R_{FIN}^{RE,D} = 0.0845 - 0.0667 + \frac{0.0667 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.05}{(1 + 0.071)} = 0.0801$$

$$\Rightarrow EATR_{FIN}^{RE,D} = \frac{0.1429 - 0.0801}{0.1905} = 0.3294 \approx 32.9\%$$

(v) Inventories

Parent company located in France:

$$R_{INVENT}^{RE,D} = 0.0936 - 0.017465 + \frac{0.017465 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.0993}{(1 + 0.071)} = 0.0867$$

$$\Rightarrow EATR_{INVENT}^{RE,D} = \frac{0.1429 - 0.0867}{0.1905} = 0.2948 \approx 29.5\%$$

Parent company located in the United Kingdom:

$$R_{INVENT}^{RE,D} = 0.0888 - 0.0667 + \frac{0.0667 * (1 + 0.071 * (1 - 0.25)) - 0.071 * 0.05}{(1 + 0.071)} = 0.0845$$

$$\Rightarrow EATR_{INVENT}^{RE,D} = \frac{0.1429 - 0.0845}{0.1905} = 0.3065 \approx 30.7\%$$

B.4. Spain: Local Business Tax IAE

While calculating effective tax rates for Spain, the local business tax (*Impuesto sobre Actividades Económicas, IAE*) constitutes a specific problem. The following remarks focus on the characteristic of this tax and the implementation in the approach by Devereux/ Griffith.

First, it is necessary to explain, that the IAE should more be characterized as a business tax on capital than as a value added tax. According to information provided by our survey carried out by PwC and to information provided by International Bureau of Fiscal Documentation (IBFD), the IAE is levied on registered legal persons conducting business in Spain. The amount of the tax depends on several factors in context of business activities like square meters of the business premises, number of employees, etc. Therefore, the tax can be clearly characterized as a non-income tax on business capital. The tax amount depends on several factors that are difficult to generalize. However, by virtue of the tax law in Spain the amount of the tax in absolute values may not exceed 15% of the average profit, i.e. there is a ceiling, which depends on profits.

It must be clarified, to what extent the IAE can be included into our calculations. Since all factors determining the tax amount can not be generalized, it might be difficult to calculate an average case. Especially, the relation between invested capital and a representative tax amount of IAE cannot be determined. However, the IAE amounts to between 0% and 15% of profits due to the ceiling. Therefore, it seems to be reasonable considering an average case depending on the profits. That means, an average tax of 7.5% of profits is chosen while calculating the EATR.

Then, we obtain the following combined tax rate for Spanish basic case:

$$\tau_{IAE} = 0.075 \cdot [1 - (\tau_{CIT} + \tau_{SUR})] = 0.075 \cdot 0.75 = 0.05625$$

$$\tau = \tau_{CIT} + \tau_{SUR} + \tau_{IAE} = 0.25 + 0.00 + 0.05625 = 30.625\%$$

Whereas the rate of the corporate income tax is denoted by τ_{CIT} ; the chamber of commerce surcharge net of corporate income tax amounts to 0.4875 % on corporate income and is denoted by τ_{SUR} ; and the tax rate of the IAE is denoted by τ_{IAE} .

Finally, we have to consider different assumptions about profit levels, while including the IAE into the model. Above, we calculated an EATR, which is based on a pre-tax rate of return at 20%. If we assume a smaller pre-tax rate of return, e.g. for the EMTR, the IAE must be assumed to remain on a constant level, i.e. the tax amount of the IAE in absolute values does not depend on profitability. Nevertheless, the ceiling is profit based. Therefore, while assuming a constant amount of IAE whereas the profitability is reduced, the amount should converge against the ceiling of IAE. Considering our assumptions about IAE of 7.5% of profits in case of a pre-tax rate of return of 20%, the ceiling is reached with a pre-tax rate of return at 10% or below. Thus, it is reasonable to assume the ceiling amount, when we calculate the EMTRs for Spain. In case of EMTR, the combined tax rate thus is

$$\tau_{IAE} = 0.15 \cdot [1 - (\tau_{CIT} + \tau_{SUR})] = 0.15 \cdot 0.75 = 0.1125$$

$$\tau = \tau_{CIT} + \tau_{SUR} + \tau_{IAE} = 0.25 + 0.00 + 0.1125 = 36.25\%$$

To sum up, the Spanish local business tax can be characterized as a non-income tax on business capital.

B.5. Hungary: Local Business Tax

In Hungary, a local business tax is imposed beside the corporate income tax. The base of this local business tax deviates from the base for corporate income tax, e.g. interest paid or depreciation cannot be deducted for local income tax purposes. Therefore, the tax base has to be modified, while calculating effective tax rates in the case of Hungary. Since 2004, an innovation tax is imposed additionally, which has the same modified tax base like the local business tax.

In 2002 and 2003, the following calculation is applied. The statutory rate of corporate income tax is denoted by τ_{CIT} and the combined rate, which consists of corporate income tax rate and local business tax, is denoted by $\tau_{Combined}$. First, the interest deduction is modified by a factor β , where

$$(1) \quad \beta = \frac{\tau_{CIT}}{\tau_{Combined}} = \frac{0.18}{0.1964} = 0.9165.$$

Second, the depreciation allowances are shortened by this factor β , while calculating with the combined tax rate of 0.1964.

In 2004, 125% of the local business tax could be deducted from taxable profits. In addition the rate of corporate income tax was reduced and an innovation tax of 0.2% was introduced. Then, the β factor is,

$$(2) \quad \beta = \frac{\tau_{CIT}}{\tau_{Combined}} = \frac{0.16}{0.1776} = 0.9009.$$

In addition, the depreciation allowances are shortened by this new factor β . Furthermore, since 2004, only 50% of interest income was taxed by the local business tax. Therefore, $\tau_{Combined}$ is modified in case of investment in financial assets. Then, $\tau_{Combined,FinAsset}$ is 0.1688 and $\beta_{FinAsset}$ is 0.9479.

Since 2010 the additional expense of 125% of the local business tax from taxable profits was reduced to 100%. Furthermore, the rate of corporate income tax was increased to 19% and the surcharge was abolished. Meanwhile the innovation tax has been increased to 0.3%. In 2017 the corporate income tax rate has been further reduced to 9%. Then, the β factor is,

$$(3) \quad \beta = \frac{\tau_{CIT}}{\tau_{Combined}} = \frac{0.09}{0.11093} = 0.8113.$$

Furthermore, since 2006, 100% of interest income is exempt from the local business tax and the innovation tax. Therefore, $\tau_{Combined}$ is modified in case of investment in financial assets. In 2017, $\tau_{Combined,FinAsset}$ is 0.09 and $\beta_{FinAsset}$ is 1.0.

B.6. Sweden: Profit Periodisation Reserve

A profit reserve, which can be constituted to avoid taxation for several years, constitutes a specific technical problem in order to calculate effective tax rates in case of Sweden. Swedish companies can set up a profit reserve, which is tax exempt, of 25% of its annual profits. After 6 years, the reserve has to be suspended and is taxed accordingly. Thus, the total effect of this measure is a tax deferral. This tax rule is included into the Devereux and Griffith model by discounting the statutory tax rate. The Swedish statutory tax rate on corporate income is 28%. Since 25% of the annual profits can be put into the reserve and a tax deferral of 6 years is allowed, the effective statutory tax rate can be described as,

$$(1) \quad \tau_{effective} = (0.28 \cdot 0.75) + (0.28 \cdot 0.25 \cdot 1.071^{-6}) = 0.2564.$$

This rule was applied until 2005. Since 2005 deemed interest on the profit reserve is treated as taxable income. Thus, the present value of the tax payments equals an immediately tax payment. The deemed interest on the accumulated tax allocation reserve is calculated as 72% of the interest rate on governmental debt notes (assumed to equal the model's nominal market interest rate). Given a statutory rate of 28% (until 2008, 26.3% thereafter), the effective statutory tax rate is now described as

$$(2) \quad \tau_{effective} = (0.28 \cdot 0.75) + (0.28 \cdot 0.25 \cdot 1.071^{-6}) + (0.25 \cdot 0.72 \cdot 0.071 \cdot 0.28 \cdot APVF) = 0.2734$$

where APVF is the annuity present value factor, and

$$APVF = ((1+0.071)^6 - 1) / ((1+0.071)^6 \cdot 0.071).$$

B.7. Estonia: Split Rate System

In Estonia, retained profits are not taxed since 2000. Corporate profits are only taxed, if they are distributed. This rule equals a split rate corporate income tax system. The taxation of distributed profits by τ^D is included into the Devereux and Griffith model by a modification of the factor γ . Retained earnings are not taxed ($\tau = 0$) and the tax rate on distributed profits amounts 20% ($\tau^D = 0.20$) in 2017.

In Estonia, the following factor $\gamma_{splitrate}$ is applied:

$$(1) \quad \gamma_{splitrate} = \frac{1 - \tau^D}{1 - \tau} \gamma = \frac{1 - \tau^D}{1 - \tau} \cdot \frac{(1 - m^d)}{(1 - c) \cdot (1 - z)}.$$

B.8. Belgium: Notional Interest Deduction

Since 1 January 2006 (tax year 2007), Belgium applies a notional interest deduction (or “allowance for corporate equity” ACE). The idea of such a notional interest deduction is to tax profit irrespective of the source of finance. While in case of debt-financed investments the paid interest is deductible from the taxable base and thus reduces the tax due, interest on equity usually is not tax deductible, resulting in a higher tax burden in case of equity financed investments. To attenuate this debt bias, the notional interest deduction allows deducting a “notional” interest on equity-financed investments.

The notional interest deduction is applied to equity, after correcting for a number of issues. The most relevant corrections relate to assets which do not generate income on a structural basis, shares held in the company itself (own shares), shares held as financial fixed assets, and other shares. In the model therefore, notional interest is deductible in case of domestic investments (and inbound investments on the subsidiary level). It is not deductible in case of cross-border outbound investments financed by new equity or retained earnings. If, however, the subsidiary is financed by debt, the notional interest deduction is applied to equity of the parent.

The Belgian government annually sets the notional interest rate. It is based on the return on a Belgian 10-year state bond (OLO). The rates were for financial years 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016 and 2017 respectively 3.781%, 4.307%, 4.473%, 3.80%, 3.425%, 3%, 2.742%, 2.63%, 1.63%, 1.13% and 0.237%.

The notional interest deduction is included in the model by adding the correction terms F^{ACE} to F^{NE} and F^{RE} , page B-3 in this report:

$$F_{ACE}^{NE} = F^{NE} + F^{ACE}$$

$$F_{ACE}^{RE} = F^{RE} + F^{ACE}$$

F^{ACE} corrects for the notional interest deduction, i.e. it deducts the non-taxed part of the profit from the taxable base. It amounts to

$$F^{ACE} = i_{ord}(\tau_{res} - \tau_{ord})(1+e) \frac{\gamma}{1+\rho}$$

i_{ord} is the notional interest rate (OLO rate), τ_{res} is the tax rate on the profit above the notional interest rate (i.e. 33.99% in Belgium), τ_{ord} is the tax rate on the notional interest (i.e. 0% in Belgium).

If the notional interest rate and the debt interest rate are equal, investments bear the same tax burden irrespective of the source of finance. In other words, if $i_{ord} = i$ (i.e. 7.1% in the model) and $\tau_{ord} = 0$, $F^{ACE} = F_{DE}$ on the corporate level, we have identical equations for all sources of finance - and identical effective tax rates or cost of capital. However, the more the actual notional rate applied, i.e. the OLO rate in Belgium, falls below the nominal interest rate, the larger becomes the gap between equity and debt financing. The graph below shows how the gap between equity financing (retained earnings or new equity) and debt financing for cost of capital, EMTR and EATR evolves with varying OLO rates. With a OLO rate of 3% the cost of capital (EMTR, EATR) for equity financing is 2.1 percentage points (29.3, 6.8) above the level for debt financing. The gap becomes nullified with an OLO rate equal to the nominal interest rate of 7.1%. An OLO rate of 8% makes equity financing less costly with a gap of -0.5 percentage points (-10.0, -1.5).

Gap between equity- and debt financing in percentage points, based on the nominal interest rate $i=7.1\%$ and varying OLO rates. The underlying effective tax rates are given for an investment in financial assets on the corporate level. The horizontal axis shows the OLO rate levels. The vertical axis measures the difference $ETR^{equity} - ETR^{debt}$ for the respective OLO rate (in percentage points).

In addition, Table B-7 contrasts the 2017 corporate-level effective tax rates on domestic investment in Belgium respectively for the case of a notional interest rate equal to the return on a Belgian 10-year state bond (OLO) and for the case of a notional interest rate equal to the nominal interest rate of the applied model. As explained above, full financing neutrality is achieved only for the case that the notional interest rate equals the interest rate on debt capital, i.e. 7.1% in the model.

Table B-7

Effective tax rates on domestic investment in Belgium, NID with actual vs. model interest rates

| Notional interest rate = 0.237 % | | | | | | | Notional interest rate = 7.1% market interest rate in the model | | | | | | |
|----------------------------------|----------------------|-------------|-----------|------------------|-----------|-------|---|----------------------|-------------|-----------|------------------|-----------|-------|

In this paragraph we will briefly discuss to what extent the insights gained from the model carry over to the real world context. A central question with regard to a notional interest deduction is to which extent it achieves financing neutrality. Financing neutrality is achieved if the notional interest rate equals the rate at which the investor discounts the future notional interest deductions, i.e. tax allowances. As the Devereux/Griffith methodology models investment under certainty, the model's uniform market interest rate of 7.1% reflects the interest paid on all debt and it is also the investor's one and only discount rate. It is thus the clear and consistent benchmark referred to in the above explanations. If the notional interest equals 7.1%, financing neutrality is achieved (see the graph and Table B-7).

In the real world investment is risky. Moreover, no tax system allows full loss-offset, i.e. with interest added to loss carry-forwards and a tax credit for unutilized deductions in the case of bankruptcy. The more the loss-offset is actually limited, the more relevant is the uncertainty because some or all of the notional interest might effectively turn out undeductible when the company becomes loss-making or even goes bankrupt. The rational investor will consider the risk attached to the investment in the firm and the resulting uncertainty of future tax allowances. His discount rate should thus correspond to the interest rate at which the firm can borrow from the capital market. As a consequence, a plausible real-world benchmark to assess to what extent the notional interest deduction, on average, achieves financing neutrality would be some average return on long-term corporate bonds (under full loss-offset it would rather be a risk-free interest rate. For more on this issue, see *Dimensions of Tax Design: the Mirrlees Review*, J. Mirrlees, S. Adam, T. Besley, R. Blundell, S. Bond, R. Chote, M. Gammie, P. Johnson, G. Myles and J. Poterba (eds): 977-978).

In conclusion, the applied model, while being rather parsimonious in its economic assumptions and the extent to which uncertainty is explicitly modelled, reveals quite clearly how the economic implications of the notional interest deduction depend on the applied deemed interest rate relative to the adequate benchmark, which is the capital market interest rate. Quantitatively, however the adequate real-world benchmark interest rate can differ from the model's uniform interest rate of 7.1%. A plausible proxy would be the actual interest rate on long-term corporate debt.

B.9. Italy: Notional Interest Deduction

Italy has introduced a notional interest deduction in December 2011 which was applicable retroactively from 1 January 2011 on. The notional interest rate on equity was 3% for the years 2011 to 2013, 4% in 2014, 4.5% in 2015, 4.75% in 2016 and 1.6% in 2017.

The model implementation of the Italian notional interest deduction corresponds to the case of Belgium (see Section B.8). However, the tax rate on the notional interest, τ_{ord} , remains positive because the ACE does not apply for the purpose of the Italian local tax IRAP. As a result, the notional interest is still included in the IRAP tax base (as is the actual interest paid on debt capital). Consequently, τ_{ord} equals the general IRAP tax rate of 3.79% ($\tau_{ord} = 0.0379$). The combined corporate tax rate τ amounts to 31.3% and includes the corporate income tax rate of 27.5% and the IRAP rate of 3.9% with 10% of the IRAP being deductible from the corporate income tax base. Profits above the notional interest rate are thus taxed at 31.3% ($\tau_{res} = 0.313$). With respect to cross-border outbound investments, the notional interest deduction only applies if the subsidiary is financed by debt. This is considered in the computations

Table B-8 contrasts the 2017 corporate-level effective tax rates on domestic investment in Italy respectively for the case of the actual notional interest rate of 1.6% and for the case of a notional interest rate equal to the model's nominal interest rate of 7.1%. For a careful interpretation of the 7.1% benchmark and some remarks on how the insights gained from the model carry over to the real world context, please see Section B.8.

B.10 Turkey: Notional Interest Deduction

Turkey has introduced a notional interest deduction on equity with effect from 1 July 2015. 50% of the notional interest amount calculated over the cash increases of the paid-in capital of corporations is deductible from the corporate base.

The model implementation of the Turkish notional interest deduction corresponds to the case of Belgium (see Section B.8). The notional interest rate is calculated by considering the “annual weighted average interest rate applied to Turkish-denominated loans provided by banks” which is announced annually by the Central Bank of Turkey. For 2017, no announcement has been made yet. Therefore, we take the average of the respective figure from 06/01/2017 to 01/12/2017 which amounts to 14.83%. We take into account that only 50% of the notional interest on the qualifying equity capital increases can be deducted. If the equity is used for financing outbound investments (foreign subsidiaries), the notional interest deduction is not applied. This is considered in the computations.

Table B-9 contrasts the 2017 corporate-level effective tax rates on domestic investment in Turkey respectively for the case of the actual notional interest rate of 14.83% and for the case of a notional interest rate equal to the model’s nominal interest rate of 7.1%. For a careful interpretation of the 7.1% benchmark and some remarks on how the insights gained from the model carry over to the real world context, please see Section B.8 (Belgium). Note that in the case of Turkey, the actual notional interest rate is currently above the model’s nominal interest rate whereas in Belgium it is the other way around.

B.11. Cyprus: Notional Interest Deduction

In July 2015, Cyprus introduced a notional interest deduction which was applicable from 1 January 2015 on. The amount deductible is calculated by multiplying the new equity issued in the form of paid-up share capital and share premiums and used in the business by the highest of either the 10-year government bond of the state in which the new equity is invested, plus a premium of 3%, or the yield of the 10-year Cyprus government bond, plus a 3% premium, on 31 December of the prior tax year. It is assumed that the yield of the 10-year Cyprus government bond exceeds the one of other states in which Cyprian subsidiaries are invested. Hence, the notional interest rates for 2015, 2016, and 2017 are 8.037%, 6.685%, and 6.489% respectively. The notional interest deduction is limited to 80% of the taxable income generated by the assets and activities financed by the new equity under consideration. By assumption, this limitation does not apply in the model framework.

Table B-10 contrasts the 2017 corporate-level effective tax rates on domestic investment in Cyprus respectively for the case of the actual notional interest rate of 6.489% and for the case of a notional interest rate equal to the model’s nominal interest rate of 7.1%. For a careful interpretation of the 7.1% benchmark and some remarks on how the insights gained from the model carry over to the

real world context, please see Section B.8 (Belgium). Since the actual notional interest rate in Cyprus of 6.489% is close to the model's nominal interest rate of 7.1%, the gap between equity and debt financing is comparatively small. Note that the notional interest deduction does not apply in case of an investment in financial assets, since the return on financial assets is not subject to the corporate income tax.

B.12. Portugal: Notional Interest Deduction

Portugal has introduced a notional interest deduction with effect from 1 January 2017. The model implementation of the Portuguese notional interest deduction corresponds to the case of Belgium (see Section B.8). The amount deductible is calculated by multiplying the notional interest rate of 7% with share capital contributions subscribed in cash or through the conversion of shareholder loans made on or after 1 January 2017. Contributions in kind do not qualify for the deduction. Moreover, the deduction is limited to a maximum amount of EUR 2 million. By assumption, this limitation does not apply in the model framework. The deduction is only available in the year of the contribution and the following five fiscal years. Furthermore, for taxpayers applying the notional interest deduction, the limitation of the net financing expenses will be the higher value between EUR 1 million and 25% of the income before depreciations, amortisations, net financing expenses, and taxes (instead of the standard 30%).

Table B-11 contrasts the 2017 corporate-level effective tax rates on domestic investment in Portugal respectively for the case of the actual notional interest rate of 7% and for the case of a notional interest rate equal to the model's nominal interest rate of 7.1%. For a careful interpretation of the 7.1% benchmark and some remarks on how the insights gained from the model carry over to the real world context, please see Section B.8 (Belgium). Since the actual notional interest rate in Portugal of 7.0 % is close to the model's nominal interest rate of 7.1%, the gap between equity and debt financing is comparatively small.

B.13. Germany: Investment Allowance for SME

In the case of Germany, a specific allowance is available for SMEs. An enterprise may set up a reserve for a new investment in fixed assets up to 40% of the expected acquisition costs prior to two years the investment is carried out if the working capital of the enterprise is below 204,517 €. This investment reserve is dissolved and charged against ordinary depreciation plus a maximum 20% allowance in the year of acquisition.

This can be considered in the model framework by an adjustment of the present value of depreciation, A . The effect of the tax free-reserve two years before the investment is considered as a higher present value of the depreciation. Then, in the investment period, the reserve is dissolved and charged against ordinary depreciation of 20% and an additional depreciation, i.e. the total effect on taxable profits is zero in the investment period.

B.14. Partnerships

Partnership taxation can follow the corporation principle or the transparency principle. If the corporation principle applies, there is strict separation between the partnership and the partners. Basically, partnership taxation based on the corporation principle follows the same concepts as the taxation of a corporation. Thus, this case is calculated according to the ordinary model framework for incorporated companies. If the transparency principle applies, there is no strict separation between the partnership and its partners. Partners are subject to the income tax with their share of profits and the income is taxed in the hands of the partners right when accrued at the partnership.

To model and approximate partnership taxation under the transparency principle, the partner's income tax rate is considered as the tax rate on the investment profits τ . At the same time, there is no further taxation of distributed profits (i.e. $m^d = 0$). The tax rate on the alternative investment, m^i , is considered in the same way as in the case of an incorporated company. Since capital gains taxes are levied on assets and not at the shareholder level, these are not considered in the case of partnerships (i.e. $z = 0$).

Under transparent taxation of partnerships the profit tax rate is the partner's effective income tax rate as opposed to the effective corporate income tax rate taken into account under the standard model framework. For the example of Germany in 2017, the effective profit tax rate on corporate investment is 31.610 %, taking into account the local trade tax, the corporate income tax, and the solidarity surcharge (see Appendix A, Table A-1).

For transparently taxed partnerships, the effective profit tax rate is replaced by the immediate taxation of the shareholder:

$$\tau = 4.51 * 0.035 + (0.45 - 3.8 * 4.51 * 0.035) / 4.51 * 1.055 = 0.4923 = 49.23\%$$

The partners are assumed to be taxed at the top personal income tax rate of 45%. Moreover, the income is hit by the local trade tax (multiplier: 451%, base rate: 3.5%) which, however, is partly creditable against the personal income tax. As in the case of corporations the tax payment is increased by the solidarity surcharge of 5.5%.
